3085. A little program for 800 XL

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-07 00:00:00 UTC
From: u.kummerow@tbx-2.berlinet.in-berlin.de
Message-ID: <5jR91IMM3KB@talktalk.tbx-2.berlinet.in-berlin.de>
Source record: 92776

Hallo !

This is my very first letter here, and I hope, that I didn't break the
(unknown international) rules :-) (I am living in Berlin/Germany)
But I think, you can need new little stuff for the old 8 bit computer.
(ABBUC-Magazin-Disk Nr. 21, program-name: "SALAT")

I wrote a programm (with very confused lines) to the ABBUC-Club.

Now I transfered it to the PC with a ATARI-DD-Disk and a PC-program.

Little program follows (only for turbo-Basic ?, I don't remember/forgot
all):

```
5 REM GRAPHICS 0:? :? :? "please input speed (i.e.0)"
6 INPUT PAUS:PAUS=PAUS+1:H=200
100 LIST 1,10400:LIST 1,10400:A=PEEK(88)+PEEK(89)*256
200 FOR B=A+(22*40) TO A+(22*40)+39:POKE B,0:NEXT B
300 FOR B=A+(23*40) TO A+(23*40)+39 STEP 2:POKE B,72:POKE B+1,74:NEXT B
400 FOR ZEIL=21 TO 0 STEP -1
500 H=200:UEE=0:FOR C=A+ZEIL*40 TO (A+ZEIL*40)+39:
600 REM IF PEEK(C)<>0 THEN GOSUB 10000
4000 H=200:UEE=0:NEXT C:FOR WOLF=1 TO 10:NEXT WOLF:NEXT ZEIL
5000 SOUND 1,H,10,0
6000 GOTO 6000: REM wait and see the confused screen
10000 D=PEEK(C):Z=C:POKE Z,0
10050 IF G=0 THEN POKE Z,0
10100 G=PEEK(Z+40):IF G=0 THEN POKE Z+40,D
10200 FOR K=0 TO PAUS:NEXT K:IF PEEK(Z+80)<>0 THEN RETURN
10300 Z=Z+40:H=H-13:LOL=LOL+5.0E-13:DRK=DRK+LOL:UEE=INT(DRK)+2
10400 SOUND 1,H,10,UEE:GOTO 10050
```

Example (last screen-line at program-end):
```
10400GSOUND01,H,10,UEE:GOTO+1005013:DRK=DRK+LOL:UEE=INT(DRK)+2IL:NEXT B
```

Remember it is a very confused code.
In Reality is was only a test version for the ABBUC, but the ABBUC took
this to the monthly disk without changing (better code from me)...

What does the program do:
All listed letters are faling down. At the end you have a hill of confused
letters with no spaces. It is a letter-salat.

Hallo !

Please hold *(all)* your old 8bit computers and dont do it in the trash.
In the futur the old 8bit Computers will be very interested with
emulators on the PC (MSX,C64/ZX/CPC/...). The name is NOSTALGIE...

It is a special feeling, to play with old software-computers at the PC.

I have just connected the 800XL with the modern PC (with DD-disk).
It worked fine.

My PC-basic is bad, my ATARI-basic is better. So I worked with the PC-
Files in the ATARI, and then I took the PC-files back. Or I maked
"PC-files" at the ATARI (GR.8-(BASIC)-graphics, heads,...).

*"ESC*PE"* : The *best Parfuem* for Computer-User ?

From: sikkens@scs.unr.edu
Message-ID: <3m254n$5ak@silver.scs.unr.edu>
Source record: 92780

I've got the following system for sale:

Atari 130XE Base Unit
Atari XF551 Double Sided Double Density Drive
Atari 1025 Line Printer
Atari 850 Serial/Parallel Interface
All Hookup Accessories
Extensive Library of Software (Disk based) Including:
Financial / Spreadsheet
Games
Application
Terminals
Etc. Etc.
Some Cartradge Software
Joysticks
Drawing Tablet
Tape Drive
Monochrome Monitor (Green Screen)

Asking Price: $150 + Shipping. All reasonable offers accepted. All equipment in 100% working condition. Most manuals and some origional boxes included.

In <3m1qgs$lau@nic-nac.CSU.net> kendrick@zippy.sonoma.edu (William Kendrick) writes:

>I wanna know.. what speed PCs CAN SIO2PC run on!? Can it even work on, like,
>a 386 or 486!? At ALL!?

I find that it works just fine on my 386-20 (DX, not SX). Under
Windows, it just won't work when in the background, even with huge
priority. If it's in the foreground with "exclusive" set, then it
runs just fine.

Once in a while, the Atari has trouble reading a sector and makes that
weird noise. My guess is that it's due to using a huge virtual disk,
so it's not in memory, and I have a slow RLL (60ms?) drive.

Has anyone gotten it to work in the background with Windows? OS/2?
What CPU speed?

Now whatever happened to that SIO2UNIX project? That was for Linix,
right? (I'm thinking of switching to Linix--can it run DOS processes
that access the com ports?)

> public access the way that i will not earn any money from it ?"

>I did not think to much about the form of question but you got the idea.
>So what are my chances to get "YES" ?

The big task is tracking down the copyright holder. This may be a
pain for companies that don't exist anymore.

You should also be careful not to ask them to release them into the
public domain--their lawyers would tell them to say no, to avoid
losing rights to other versions. What you want is a written "license"
to redistribute the Atari 8-bit implementation of their programs. You
should offer to include whatever copyright information they wish to
include, perhaps even making the programs shareware. (This addresses
a fear that one company alegedly expressed in a previous attempt.)

If the proposal is well-worded, and you can track them down, I think
you have pretty good odds.

3092. Re: HyperIt! 0.5 beta mailing

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-07 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3m2gq2$661@nic-nac.CSU.net>
Source record: 92783

HyperIt! is based on HyperCard for the Macintosh. Many interfaces work similarly: HTML (The World Wide Web), MS-Windows online help documents, MacroMind Directory, etc.

The interface gives you a mouse pointer (currently controlled with joystick or keyboard) with which you can click "hot" areas on the screen.

The "programmer" interface is part of HyperIt!. The creator of a stack (which is a set of cards: screens containing graphics, text and buttons (hot areas)) designs their stack (either before or while they're "programming" it). A button in card-X will bring up card-Y. A button in card-Y will set a variable to "1". Another button will go back to the previous card. Another button in card-X will go to card-Y if the aforementioned variable is "0", otherwise it will go to card-Z. You get the picture?

Anyway, the current support is:

Text (40x24)
Buttons (textual)
Button areas (covering graphics and/or text)
Fonts (1K screen fonts)
Links to cards
Jump links to cards (go back without knowing where you came from)
Return from cards
Load image
Load image as a background (gets buffered or comes from buffer if already in it; kind of like an image cache)
Re-view background (like trying to load the same image: gets taken from buffer.. but you don't need to know what image file it was)
Plot / Line / Square
Color palette setting

Future support will be:

Special effect transitions between cards (maybe!! probably not!?)
Daisy Dot 3 font/text support
Variables
If/Then blocks
Sound (digital)
Music (AMP or Pokey-Player?)
Icons (small images)
Icon animation
WYSIWYG card/stack editor (maybe?)

I could kill the current HyperIt! format and start from scratch.. dunno.

later!

I think it's a rather fantastical thing to consider writing for the A8.
Imagine trying to write a Mosaic port with inline Jpeg decoding to
ColrView mode, or try writing a newsreader in less than 64K.

I do think it would be possibe to write a Netrek port with a scrollable
Gr.15 screen.

Now THAT I'd like to see.

David,

Why, unless your PC doesn't have a modem would you want to transfer files from your 8bit to your PC. Just d/l them to your PC and copy them onto a "blank" floppy image.

Sincerely,
- Byron Followell

Tim: thanks for the info. Your problem is puzzling; this is what I've noticed:

The character display problem only occurs when Bit 6 of a character is set. The logic goes something like this:

Is Bit 6 set? If not, print normal character
Else
Deselect bit 6
Is Bit 5 set? If not, then set it
Else
Deselect Bit 5.

Could there be some sort of bridge between two of the data lines somewhere? (just asking) Hope this is of some help.

3100. another vendor

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-08 00:00:00 UTC
From: bjcorr@delphi.com
Message-ID: <9504081327592.DLITE.bjcorr@delphi.com>
Source record: 92655

I was reading onr of the trade journals recently and an ad caught my eye. It was for an 8-bit graphics tablet (new!) from a vendor named More Than Games in Austin Texas. Shipped off my $12 and got back a cartridge and graphics tablet called Super Sketch. Interesting toy, it allows you to draw (in one of 4 colors) with a stylus attatched to a long arm that slides up,down, left and right at the top of the tablet. You can attach drawings (1/2 page length or less) to the tablet and trace them onto the screen. Has color selection (16 colors, 8 luminances, 4 at a time), 5 patterens, 7 different brushes, has block copy and move, has circle,box and ray functions, several types of mirror options, load, save etc.. A nice begginers tool, not for high end graphics but great for kids.

I also got a catalog from them listing a decent amount of 8-bit software and some hardware. They had an 800XL with the XLBOSS switchable OS and OSN6 with Omniview on it for $42.50! Omnimon and Omniview for the 800 was $16.58. XF 3.5" drive mod for $30.LOTS of games for around $5 or less (Drop Zone for $2.54, all the SSI simulations for $3.83) 11 Infocom adventures for $8 each. Their catalog is worth a SASE anyway;

More Than Games
8207 Briarwood Lane
Austin, TX 78757-7642

A PBI Experimenter Kit for $12.75! 256K DRAMS 120 ns for $1.96!
And they are the only place I have seen that sell cables for the multi computer game Maze of Agdagon ($3 for the game and $15 for a 20' 2 computer cable. You can get the game free from umich and instructions on how to make a cable, but hey...) sort of a midi maze for the 8-bit.

>software packages I've tried--FlickerTerm and OmniCom--don't seem
>to have that, and I don't have an 850 initialization program laying
>around anywhere. Can it be found via ftp? On UMich, perhaps? And
>what would it be called?

Well, if you have DOS 2.5, youcan run its SETUP.COM program,
select option 3 (Set up an AUTORUN for boot), then select option 1 under
that (the RS232 (R:) drivers for the ATARI 850 Interface Module are loaded
and made active.)
This will write an AUTORUN.SYS file that will do this. Then,
just go to the DOS menu, and copy (append) your FT80 or other term
program to this AUTORUN.SYS file.
Finaly, reboot with this disk in the drive and your 850 turned
on, and the drivers should load automatically just prior to you term
program loading.

David; it's one of those things that is technically possible but difficult. No one seems to be willing to commit to taking on the project & even if they did, expect a long development. The Atari GTIA only puts out chroma & lum signals along with sync info. Several manufacturers make single chip solutions to go from chroma=>RGB <BTW: What's a Sandcastle pulse?> but typically they need a handfull of inductors/filters/analog support componets that scare most of us digital guys off. RGB monitors that'll sync down to 320x200 like the SC1224 are going to get to be hard to find, I don't think anybody's even making one anymore. I doubt if there's 10 people in the world that even have the combo of a spare RGB monitor & 800xl that they would want to hook to it. Of those 10, I doubt if more then one or two would have the technical expertise to duplicate a circuit someone else developed. Most of projects that get done now just seem to be targeted for a wider slice of the Atari community.
Rick

RE: Wooley's 80 column mod. Hopefully Bob will jump in here to help out,
I seem to have suffered a minor mishap: The storms in California blew
part of the roofing off my storage shed & all my SLCC journals got trashed!
But from memory. He made a daughter board that took almost all the signals
it needed from the GTIA socket. The main componets were a 6545 vidio chip
with something like a 32k static ram. He replaced the existing clock circuits
with a 14.318 mHz oscilator & a programable divider, something like a 74LS193
but I'm not sure about the number, they're all similar anyway. The rest of
the circuit was a character ROM or RAM, a parallel to serial converter
[74LS165], & a few glue chips. He tapped the 74LS193 at the f/4 pin & used
that as the 3.579 system clock going into GTIA. He fed the f/2 into
the clock pin of the '165. I don't know if you're familiar with the 6545/6845
series of chips, but in general, all they do is retrieve a byte from memory
& use it as an index into the character ROM. They have 5 bits of counter
output so they can step through sequential bytes of character ROM for a
given character. The data just gets stuffed into the '165 & get's clocked
out. Bob combined the output of the 6545 with he existing circuitry so you
could get 80 column composite video comming out the back of your Atari.
He did a lot of other stuff, like combining the 80 column video with existing
graphic modes, but the hack never became popular. It was just to advanced of
a project for a normal human being to attempt. 100+ pins of wirewrap with
a handfull of IC's! Makes putting a Rambo in a computer seem like flipping a
switch! I think about it from time to time, there's a number of things I
would have done to simplify it, like maybe build it into a cart & forget
about combining video. Just a 9 pin IBM style mono output would make me
happy. But then I don't care about things like ANSI graphics & I just noticed
I don't have a *SINGLE* vga picture viewer or paint program for my clone.

HOwdy y'all

I just wanted to ask ya WHY IS THAT SIO2PC CABLE IS SO EXPANSIVE ?
I mean, look at x1541 cable .. it is easy to build and easy to use.
Why it is not possible to build something like that for ATARI ?

And one more, Where can i get the scheme for building SIO2PC ?

Artem

I am looking for the following:

Atari XE Game System, with original boxes. Must contain all original equipment, including Flight Simulator II, the gun, documentation, etc.

Atari XF551 Disk Drive. Same as above.

Please e-mail me with what you have and your asking price(s).

Also, looking for original cartridge software, preferably with boxes.

Looking forward to buying asap. Thanks, and peace...

Brian

3112. Re: What's your highest colony score in M.U.L.E.?

>it to $120,000? Can you ever get a message better than the one you get
>about "living on estates" which you get for scoring $100,000+? (Oh, and
>is there a message saying "the colony failed miserably" or something to
>that effect? I've seen scores as low as $54,000 and even then, the
>colony "succeeded...barely."

My personal besMy personal best is around $105k. That was against 3
computer players. Playing "live"with thre others I've hit around 90k -
would have done better, but they sat on me and refused to let me take any
actions for the last two auctions (things got bitter, OK?)

I have deliberately sabotaged colonies as well. Try this: take four
players and do nothing but gamble. In time (aoround 6 months) the colony
aborts; you've failed. I have seen final colony totlal so low that there
is no first founder.

Sorry 'bout the typos; I'm using a (erk) Win program that doesn't really
try to do VT100 - back to FlickerTerm for me!

From: krishna@primenet.com
Message-ID: <3m56pv$9kh@news.primenet.com>
Source record: 92794

In my experience, the only real advantages of TCP/IP are:

Mosaic

Netrek

If you forsake gfx and just do text, then that is essentially what Lynx is (basic WWW) and is perfectly doable on the shell with FlickerTerm. Same with entering newsgroups

TCP/IP allows you to multitask various things on your end, updated realtime all on that one shaky connection. It is probably the multitasking aspect which will be the most difficult to do on the Atari. If you start up Netrek, there is no way you are going to be able to leave it active and jump to the newsgroups. Task switch maybe, but then you'll miss a zillion packets meant for Netrek while that task is dead.

Do you see the problem here?

Whatever TCP/IP is good for, 90% of it can't be done well on the atari8. What's left can be done nearly as well off the shell.

If someone comes up with a way to have it do it right, then my hat's off to him.

By the way, I think the XEP-80 is probably OKAY!

Reason being that the XEP-80 really needs an 80-collumn mono monitor. It doesn't work well with normal monitors. The frequencies are slightly different on 80 collumn monitors.

From: ziggy29@rahul.net
Message-ID: <3m6ep6$ii0@hustle.rahul.net>
Source record: 92800

My wife and I were playing M.U.L.E. the other night, and we racked up a colony score which way *way* higher than any I'd ever seen before: well over $118,000. I had $38,000 myself, which would have been over $40,000 if the game didn't decide to take a plot of high crystite land from me in the 12th turn of the game.

Before that, the highest I'd seen was probably around $110K.

My question to you is: Have any of you beaten that? Has anyone made it to $120,000? Can you ever get a message better than the one you get about "living on estates" which you get for scoring $100,000+? (Oh, and is there a message saying "the colony failed miserably" or something to that effect? I've seen scores as low as $54,000 and even then, the colony "succeeded...barely."

Does anyone have an extra one lying around? Or maybe you know where I can find one? I'm tired of crappy output from the TV where much of the left side of the screen is not visible.

Are these really that hard to find? I wrote to comp.sys.cbm (the C= newsgroup) and had no responses.

I'd really like one of the better ones, like the 1084/1084s, but I'd consider buying any of them that are compatible with the 800XL. I will insist that all cables and power supplies (if any) are also included (unless you know a reliable source for them elsewhere).

As for price, well, probably about $40 on the low end and maybe double that or a bit more for the higher-end monitors--depending on the model, condition and parts included.

>
>Anyway, (if you can't tell) even if you DO have enough RAM to load up
>an entire disk image into RAM, you can force it to access it only from the
>HD (which is what I do). Be careful not to screw up your files though!
>Sometimes the saftey of having a backup of a disk you're playing with
>still somewhere safe (not in the PC's RAM) and screwing around with a temp-
>orary copy (IN the PC's RAM) can be very handy! :)

I would think that using a disk cache program such as
SMARTDRV.EXE on the PC would increase disk accesses significantly
in this situation. I am also wondering, has anyone successfully
run the SIO2PC software from within OS/2 Warp? Setting that up
as a background task, and letting somebody else continue to use the
PC for other things seems like a neat thing to do.

: asses. (Bite me, Trip Hawkins! Your name will live forever in Atari
: infamy!)

Dude, 20,000 piraters in a userbase of 100 million isn't going to kill
all your profits.

But 1,000 piraters in a userbase of 20,000 or however many there were at
the waning days of commercial support for the Atari8 is enough of a
percentage to kill it bigtime.

It didn't help that the majority of Atari8 users were hacking teenagers
and with the clones, their userbase is skewed far more towards the adult
and businesses, groups which are far less apt to be interested in pirating.

It's commonsense to realize that pirating was more damaging to the
fractionalized 8-bit platforms than it is for today's clones.

And another thing, today's software often costs hundreds of dollars,
whereas no real software for the Atari8 ever cost that much, even
application software. Therefore software houses are getting back more
money with each sale than they ever have.

: computer players. Playing "live"with thre others I've hit around 90k -
: would have done better, but they sat on me and refused to let me take any
: actions for the last two auctions (things got bitter, OK?)

Yow. I can imagine. My wife and I are usually a bit more cooperative
about that. Since the human players start out $200 in the hole, we are
in 3rd and 4th places. We each buy 4 energy units in the first auction
(the store starts with 8). We usually starve the computer players, which
are usually dumb enough to produce almost nothing but smithore and
crystite, assuming that *someone* will sell them food and energy... >:)

It wouldn't be a very happy household if I didn't sell her my extra
food when pests ate all of hers.

Your description of cutthroat sounds like the games I used to have with
two brothers and a friend in 5200 football.

We did cheat a bit in the last turn. I had a bunch of energy and she had
a bunch of food. In the last auction, I bought one food from her at
$250 and she bought one energy from me at $250, thus establishing a
ridiculously high price. (We still would have been over $110K without
that cheat.)

: I have deliberately sabotaged colonies as well. Try this: take four
: players and do nothing but gamble. In time (aoround 6 months) the colony
: aborts; you've failed. I have seen final colony totlal so low that there
: is no first founder.

I've never seen a colony abort...we've seen no first founder, though...
I think you need at least $60,000 to get one.

How to get *MOST* of the money:-

1. Select a two player game + 2 computer players
2. Mine crystite but don't *ever* sell to the shop
3. Wait for crystite to be a very low price
4. Keep the player with the crystite ready to sell and the player
without crystite ready to buy.
5. The computer players go into buy mode and run up to buy any
cheap crystite.
6. Send your other player up to buy the crystite, but *don't* sell it
yet. Keep pushing the price up, the computer players always match
your price. Just before the auction closes, back off your buyer
and sell your crystite to the computer players.

I seem to recall one of the American computer clubs (was it PACE ?)
had an article in it about replacing a disk drive mechanism. It was either
a RANA or an INDUS. The article came as two parts. Apparently you would
order this generic drive mechanism from somewhere. There were some long
instructions involved such as "bend up pin 1" or "now turn the entire drive
over and carefully cut the black wire", etc. I think the article was about
replacing the INDUS drive because, if I remember correctly, the article
ended by saying that after you were finished, something called
"synchromesh" would no longer function. The article said that replacing
the mechanism would take about a half an hour. The article was quite long,
longer than the article about the Buckholtz RAM upgrade, even. I thought
it was quite interesting at the time, that you could replace one of the old
drives with a modern mechanism.

Does this sound familiar to anyone ?

Source record: 92676

Hi All,

Just made it back from Canada... A well needed vacation I might add!! Sometimes it's better to just get out in the field and talk to people directly about what features a product should or shouldn't have. As everyone well knows, The Sweet 16, MIO II, and MARS 8 have encountered design problems, changes, delays, etc... I only hope that everyone can understand that even though they might be "separate" products, they all need to operate together, and not duplicate features (if possible).

I didn't expect the MARS 8 to be finished in the past few weeks, and that was accomplished by changing the SIMM on board to address '816 memory as opposed to banked-memory. There will be a jumper on-board to select whether the SIMM is active or not. The MARS 8 will also work with internal memory upgrades such as Rambo, Newell, or Wizztronics.

With the '816 memory going inside the computer now, I have opted to not include a socket on the MIO II. This way owners of Black Boxes and original MIO's will be able to use the memory without have to but an MIO II. For those of you that don't want a MARS 8 fear not, as Atari Classics will be featuring an upcoming article on how to add '816 memory to the PBI.

On another note, it has become obvious that the need for a high speed serial port is high for the Atari 8-Bits. I was toying with the idea of incorporating one into the MIO II, but that tends to conflict with the original goal of providing a "low-cost" IDE interface. Not to mention that people shouldn't have to purchase an MIO II to have a high speed serial port. Well, let's just say that the MIO II won't have a serial port, but... I will be making such a device available very soon. No details are available at present, but it will be soon, and it will be extremely cool...

Catalogs are being prepared, and will be shipping as soon as the MIO II's and MARS 8 goes into production. It will be very difficult to reach anyone here by voice for a while, but I always read E-Mail, and will be active here and on the FTe area on Genie.

3139. The software problem

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-09 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <xM1-QS4.ransom22@delphi.com>
Source record: 92680

An Associated Press article that appeared in my local paper titled "Are we too dependent on software?" had some interesting ponts to make on the subject of the tremendous software bloat the PC world is experiencing.

In the article, it is noted (by Charles Simonyi, a software theorist at Microsoft corp, no less!) that software packages have been growing at an incredible rate for the past few years. The reason for this is competition, according to the article. That is, if ABC company doesn't add twelve new whiz-bang features (no matter how rarely used they will be in the real world), then XYZ company WILL, and ABC Company will be shortly out of business. So, ABC adds those features, then XYZ adds those PLUS a dozen more useless features, hen ABC adds those and more, etc., ad nauseum, in a never ending feature bidding war that ultimately results in slow, resource-hogging code that is CAPABLE of doing much, much more than the original software did, but which has only very few features which actually get USED beyond what was there when the program was first offered to the public.

It is also noted that as code size increases, the difficulty in finding bugs and eliminating them becomes much greater. Anyone who has ever written a significant amount of code can tell you that.

A few real-world examples are cited, such as the software problem tht delayed the opening of the Denver airport for 18 months, and the lines of code missing from the Pentium chip that resulted in a loss of a few hundred million dollars for Intel.

It's a serious problem.

As I have said before (and will undoubtedly say again), the problem is in the mind-set of the consumers. They're locked into that "More is better" idea. I've argued to the controller of the company I worked for that upgrading software like Lotus 1-2-3 for Windows, WordPerfect for Windows, and Paradox (our three most frequenly used applications) is not necessary just because the companies that produce them decide it is time to put out a new version. Still,this normally tight-fisted man insists on spending the huge sums necessary to replace all our licenses with the latest upgrades. Worse, those upgrades involve a lot of MIS dept. time,and the users end up having to learn to deal with the new bugs in the software,when they'd learned to work around the OLd bugs already. Sigh.

But, then I go home, flick on the Atari, boot up AtariWriter+,and type happily away. Nope,it isn't bug-free. And it isn't perfect. But, I can do my work withit, and never get surprised by a bug any more. I know how to work with it. The price I paid for it, spread out over

the years of usage, is virtually nothing now. I'd wager I am much more productive with it than my office mates are with WordPerfect right after the new version comes out. ;)

So there is definitely something to be said for not keeping up with the Joneses (or the Gates', as the case may be). I'm sure my fellow Atarians know better than most the benefits of sticking with what works best for them.

And, since the code size is very limited on the Atari, I'll never encounter as many bugs in a single package as I would on the MS-DOS platform. Debugging 64K of code is a VERY different process from debugging 1024K of code. :)

There is a point at which software does not need new features. A point at which it does the job, and further development is pointless from the user's standpoint. Fortunately for me, most of the software I use reached that point about ten years ago. :) No software bloat here. . .

I think I'll go play a game of Centipede. It runs well and seems bug-free, unlike Disney's The Lion King game, or SimCity 2000, or . . .

>

Actually, the practice of not having access to the original code
is not due to any illegalities, but rather due to the desire to
absolutely gurantee the lack of any possible copyright
infringement and lawsuits.

It is pretty much a given that given a pool of groups producing
software to a rather narrow specification (say duplicating
exactly the operation of an IBM PC BIOS, or any other
duppliaction effort), there will be much duplication of code. It
is not copyright infringement to duplicate however precisely
something someone else has done, provided one can prove beyond a
reasonable doubt that your product is a result of your own effort,
without knowledge of the duplicated product. How many ways are
there to take the byte in a specific register, and dump it to a
specific output register while setting and clearing certain
specific flags and or memory locations, for example.

Those, a great number of duplication efforts maintain two groups
of programmer types, one to develop the code, the other to decide
where it's results vary from that of the desired target. Buzzword
.. clean room development. The programmers have no access to the
original code whatsoever. Any duplication is then entirely
coincedental, and perfectly legal. Of course, this then leads to
the look and feel type of law suits. Darn lawyers always have to
get paid somehow.

Rick,

10 people??! In the whole world?! Come on Rick. I think that number may be a little on the conservative side. I'd bet there are thousands of users world wide who have 8-bit computers and an ST with a color monitor. And out of those thousands there are probably more than 10 that would like to hook up the 8 bits, if it were possible. I'd also say that there were a lot more than 2 people who could build any circuit that was put in front of them. However, I do agree that it would be a fairly complex circuit with a fairly long development period. I may look into it myself, as, I just posted a similar message myself less than 2 weeks ago. Don't anyone hold your breath though. I won't have that much time to devote to it.

Sincerely,
- Byron Followell

>
>(such an interface - SIO<-->standard audio RCA hookup - DOES exist!)
>

That is indeed what I did with my first Atari, a 400 purchased at
$400. I was too cheap to buy a cassette drive, and so wired an
interface for my standard stereo cassette deck.

Fairly straightforward, bearing in mind that Atari tape decks were
stereo, and used the second channel for possible audio
information. Other than audio buffering and such, one should use
a deck with logic controls of some sort, to implement the Motor
control line from the Atari.

I did have some trouble interchanging with standard Atari decks,
generally in getting the proper levels on the tape, but it worked
in record/play mode just fine.

Being a hardware overdoer, I included a demodulator and RS-232
output stream (standard 600 baud output), but that was often
unreliable. Never used it enough to really debug it.

In a message dated 3-31-95, Glenn Saunders:

"Down the road a year or so when Atari finally slips
into bankruptcy it will probably be possible."

A lot of people seem to have the misperception that Atari is teetering on the brink of financial ruin. In fact, Atari's recent losses have been rather small, and with the influx of money from the settlement by Sega, have recently disappeared altogther. (In the most recent quarter, Atari actually posted a profit, thanks mostly to the first installment paid by Sega).

Even if Atari did no better than they have the past couple of years, their is no reason to expect them to run short of funds any time during this century.

Also, unlike Commodore, which was up to its proverbial eyeballs in debt, Atari is virtually debt-free.

The scary thing that 64K of code is a *lot* of code. I wrote a big ol'
assembly program last year, with the source spread through 41 files. It
assembled to about 16K! I've found quite a few odd bugs in there and
I'm sure there are more I don't know about. When I hear about 250,000
line applications...yikes!

From: James King <jeking7@delphi.com>
Message-ID: <Ba1cQFB.jeking7@delphi.com>
Source record: 92692

Even though I owned an original copy of AR:Dungeon/City, I decided
to purchase yet another pack from American Technavision (prce was
right!).

Odd thing is suddenly, I'm having problems booting up with both sets
of disks.

I'm using the following hardware:

Atari 130xe (320k)
256k MIO
MUX ROM
MUX Cart
Happy 1050
Happy 810

I have the 1050 Happy disabled (booting with tht drive).

AR: continues to say "Enter Disk 1, side 1 in Drive 1). No matter
what I do, it continues to give me that message. Have both
my originals gone bad?

>One quick question: is the '816 128k+ version designed to use banked or
>linear RAM? Thanks.

Banked ram still. That will be addressed in the future.

Note that it can assemble code directly into anywhere in the 24-bit
linear address space, but the program and source code are still
restricted to 16-bit space.

Basically what is going on here, is that most of the source for MAE was
written a long time ago, and it's all 16-bit code, forcing it to
execute like a 16-bit program. It was pretty easy to add the 24-bit
addressing support for assembling, and now that I have that ability, I
can use it to rewrite sections of the assembler to be 24-bit aware
themselves. Time is still the limiting commodity though. :-(

John Harris - jharris@cup.portal.com

```
>>Linear RAM expansion will be available with the Mars 8 board.
>
>Be careful with the terminology. All 65816's address memory as 64K
>banks...

The 65816 does have full 24-bit addressing modes in addition to the
16-bit with bank select on the upper 8 bits. You are still limited
to 64K with the 16-bit X and Y index registers, but you can use
self-modifying code to adjust the address in the 24-bit opcode
directly. And you can always access memory anywhere in the 24-bit
address space without needing to change upper "bank select" byte.
You just can't index past 64K when using registers.

John Harris - jharris@cup.portal.com

>Maybe not. If he uses the wrong methode of de/encodeing, the original and
>the double encoded files will be the same, but the "unreadable" file might
>not be ROT-13.

Ah, but the trick is that unlike the other encoding methods you
mentioned, rot13 is exactly the same algorithm to decode and encode.
There is no "un-rot13" -- it's all the same: just shift all the
letters halfway around (a becomes n, b becomes o.... l becomes y, m
becomes z). Shift them halfway around again, and you have the
original text.
If the rot13 program did the shifting wrong in any way, though, you
would not get the same thing out as you originally put in.

>You might think you using e.g. the ARC format, and you (and anybody who has
>your packer/depacker, can unpack it. But since it's not standard, other
>people can not depack it, because it is not in a standard format.

This part has nothing to do with rot13, but... ARC is a standard
(common, well-defined) format. I have UNARC programs on my Atari, my
DOS machine, and my Unix machine at work. It's just not as common now
as it once was, because others (e.g. ZIP) are better.
The problem of whether someone else can decode the thing simply
depends on whether that person has (or can obtain) a program to do so.

ANALOG printed a program to do that back in its heyday (before LFP)...
the program was called Streamliner. I don't have my Big Box O'
Magazines handy to give you an issue number, but I think it was in the
30s or 40s.

I really need to catch up on my c.s.a.8 reading.....

From: da_pate@pavo.concordia.ca
Message-ID: <10APR199501285077@pavo.concordia.ca>
Source record: 92607

My 800xl tends to lose 64k after it's been turned on for more than 15
minutes. At bootup, all is well. But by running the program XLETEST.BAS
in a constant loop I get the following result:

Six banks become inaccessible. It's all the banks where bit 2 would be
off ($D301= 161,169,193,201,229,237)

I've swapped PIAs to no effect. Any suggestions of what to try?
(Upgrade: 256XLE from Newell. RAM: 120ns from Siemens)

3158. HyperIt! warning: DON'T run in SpartaDOS!

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-10 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3mah5e$e9d@nic-nac.CSU.net>
Source record: 92609

Warning!!! I just got a message from John Harris saying that he ran
HyperIt! in SpartaDOS and it killed one of his hard drive partitions (he
says he can no longer write to it; hmm, I'm guessing he can at least still
read from it, which is very good! <whew!>)

Anyway, like I said to him in e-mail, please note the following things:

1) HyperIt! can NOT run under Atari DOS because it uses subdirectories
2) HyperIt! has had some trouble running under MyDOS 4.50, but it can
be done
3) HyperIt! is being developed under, and is currently runnable only FROM
MyDOS, more specifically, 4.53 and compatible (if there IS a 5.0,
I WANT it!)
4) HyperIt! can NOT run under SpartaDOS because of subdirectory access
incompatibilities (maybe), memory conflicts (maybe), and file listing
differences (probably not). So far, the one note I've received about
success/failure with running it under SpartaDOS has been this one, so..
DON'T try it!
5) NEVER run -BETA- software off of a hard drive, ESPECIALLY if it isn't
for the DOS you're using!!! :)

Thanx, John, for warning me about this, and I'm terribly sorry for the trouble!
(I tried my best to state that it's a MyDOS program, but, some of you Sparta
users are about as stubborn as some of use MyDOS users! heheh!)

Later!

>
The program you're looking for is called Streamliner, I believe. It came
out in a later issue of ANALOG. That problem is primarily due to MAC/65
disk version assemblies; I believe that the cart version produces more
linear code.

3162. Eprom programmer

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-10 00:00:00 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3maltb$9mf@usenet.INS.CWRU.Edu>
Source record: 92613

Would anyone be interested in plans to build an EPROM
programmer that uses only 4 74LSxxx ICs and one joystick port?
It uses a 74LS299 (or 74LS323), two 74LS164's and (probably)
a 74LS132. It may be a little slower than other EPROM reader/
programmers because data is clocked serialy out one serial
port but it is cheap that way. Of course you'll need a 5V
power supply, and a 12.5, 22V, etc. supply depending on the
EPROM types. "Probably means, I didn't have one, I am using
a 74LS02 (quad nor gate) with a 74LS244 ahead which has schmitt
trigger inputs. The 74LS132 is a schmitt trigger inp NAND gate.
I couldn't find schmitt trigger NOR gate :-(. Too Technical?

Problems I have and have had:

I need an EPROM eraser, the problem being I can buy a lot of
EPROMS before investing $40-$50 in one. Anyone know of a cheaper
source, parts to build one? What about other UV sources like
mineral lights. What wavelength is required to erase them.

Anyone know enough about EEPROMS. Timing characteristics and
how they are electronically erased. I would like to support
them. I have read 2764s and 27128s. 27256s, 27512s, and possibly
2732 support should be easy to add - just some switches.
The software currently supports the large eproms by programming
in 16K chunks.

I was having problems reading data back through the joystick port.
Placing a small capacitor between the data and ground seems to
practically eliminate it. I thought I seen some letters on
similiar problems with the EPROM programmer in ANTIC with some
models. Could it be caused by crostalk in wires or within the
computer? I know RS232 interfaces specify a certain slew rate.
What is the maximum rate through the joystick ports? Timing
is not critical since communication is syncronious. I want too
make sure the connection is good, because the slightest error
on output when programming an eprom could cause an error.

I haven't checked the Newell itself. When I try to access, say, bank 165, I access instead bank 161 (that is to say, bit 2 never goes high). The test program works like this: set PORTB to each bank value, write that value to four locations within the bank. Compare the results, and report any errors.

It's 50Hz and 60Hz. There isn't much of a solution, as I recall the 50Hz machines can execute more code per screen update and the 60Hz machines can't execute as much as the 50Hz machines, so some of the screen is not totally updated and it causes screen flickering. Euro machines have an easier time hacking 60Hz demos/games, because like I said their machines can execute more code in each 50Hz cycle.

(Or do I have it totally backwards? -- I don't think so, but I could).
(I checked it, 60Hz is shorter than 50Hz, as far as time goes).

I want to download shareware/freeware software off of the net and run it on the atari 800xl system which I picked up at a local thrift shop. Hardware components include a 800xl and rana 1000 disk drive which I believe to be capable of double density. The problem is that I do not have a dos boot disk to go with the machine. According the the atari 8bit faq It is posible to write to my mydos formated disks and run those programs after I boot up mydos on the atari side. My question is, is it possible to create a mydos boot disk from an Ibm drive using special software? If not, could some kind soul please mail a copy of mydos that would work with the program myutil or util. I will gladly send you a disk and postage or reimburse you. Thanks in advance.

It's important that the high speed serial interface be SIO-driven. This will allow those who run MUXes to have high speed modems. Otherwise they are stuck in 2400-buad HELL unless they have a BB on every slave.

Also, I am not in for a MARS8 because I'd want to use a 1450 or 1200XL as my main machine. That, combined with me having a BB/FB leaves me in tough shape as far as finding a method of adding 24-bit linear memory.

I've heard rumors of wiring in 24-bit memory into a 1200XL but no specifics. The only solution I can think of right now is to MUX the 14 or 1200XL and the use the PBI (hack a PBI on the 1200) for the 24-bit memory, THEN I'd be screwed for the serial.

See the problem?

My advice is to buy the rights to the R:P: from Bob Puff since he won't manufacture it...

: machines can execute more code per screen update and the 60Hz machines
: can't execute as much as the 50Hz machines, so some of the screen is not
: totally updated and it causes screen flickering. Euro machines have an
: easier time hacking 60Hz demos/games, because like I said their machines
: can execute more code in each 50Hz cycle.

To which Bosco went and made a sandwich and then replied:

The programmers in Europe should take this 60/50mhz problems into
account. This would make all their software compatable with all 8-bits.
Some of them apparently have done so, like the Hi-Tech Team and Bewesoft.

Are you programmers listening?

I am currently attempting to build a home security system using my
Atari 800. I would like to use my old cx85 keypad as the mechanism
to arm/disarm the system. My problem is that I cut off the "joystick"
plug from the keypad about 8 years ago (when my Atari lived in my car!)
and do not remember the mapping of the 9 wires back to the joystick
port pins.
Can anyone help me map the wht,gry,vio,blu,grn,yel,orn,red,brn wires?
Any help would be greatly appreciated!...

The price for the SIO2PC kit includes more than the cost of the parts.
It includes the shareware fee for the SIO2PC software and the service of
getting all the parts together in a coherent kit. I know that many
people are now capable of hacking their own cables together, but I
couldn't have. And I doubt they'd be doing so if Nick hadn't done it
first and written the software to go with it. If nothing else, consider
the payment thanks for making an Atari 8-bit <-> PC connection possible.

I always used UNIFY by Bill Wilkerson. Was in COMPUTE!, would guess in the
'84-'86 era. It made a HUGE difference in load times for my compiled Basic
progs, and a significant difference (handful of sectors anyway) in the OBJ
size.

They are going to need a good reason to give a damn. I know European
programmers for the Commodore didn't give a damn. I think a good reason is
that the userbase for this machine is diminishing quickly, and if they want
to target the entire userbase then they should come out with two version
NTSC and an PAL version. They can write it totally for NTSC code and
just throw in several NOPs to reduce flicker/etc.

CC65 supports arguments from the command lines from DOSXL and
Sparta-Dos (at least for the disk version of Sparta). I think
you have to be sure "NOARGC" is not defined before the "main"
function. (This should be the default unless its DEFINEd earlier).
If it is defined, then main won't receive the argument count.
It works like it does with most C compilers.
In my tests with a non-cli dos it returned 0 for argument count.
Under Sparta Dos, it returneda 1 with no parameters. (The first
parameter "argv[0]" is the command name. CC65 also has a function
to prompt for the command line. You can call "readargs" if argc
is <2 in case the person is using a DOS that doesn't have a
command line, or forgot to type arguments. (This is in the "IF"
statement below). This statement isn't necessary for Sparta or
DOS XL. If it doesn't work with the cartridge version of
Sparta-Dos, some changes to the RUNTIME may be necessary.
if CC65 reads your command line it should work since CC65 uses
the same routines.

I can't comment on the other C compilers.

------------------------------------------------------------------
```

```
int i;
char argbuf[200]; /* only needed for non-cli DOS's */

#undef NOARGC

main(argc, argv)
int argc;
char * argv[]; /* or char ** argv */
$(
printf("Argument count=%u\n\n",argc);

/* Only necessay to support non-cli based DOSs */
if (argc<2) $( argc=readargs("enter args>",argbuf,argv+1)+1; $)

/* read and print each argument */
for (i=1;i<argc;i++)
printf("%s\n",argv[i]);

while (1); /* infinite loop */
$)
```

Source record: 92624

There are very few games with running problems caused by the 50/60Hz situation. It is correct that the European PAL 50Hz machines do have slightly more time for the VBIs than the NTSC 60Hz machines do.

It would seem there is more likely to be a problem with European sourced software working with US machines rather than the other way round. Indeed this has been observed with some European demos and I know of two commercial software titles that have problems. These are One Man & His Droid, a budget game from Mastertronic. This one apparently has a fine title screen but when the game starts the screen rolls vertically making it impossible to play. The other game is a horizontally scrolling shoot em up from Tiger Developments, the name escapes me for the moment, however the author did tell me he rewrote the VBI after he heard about the problem, so its not really a problem any more. The sad thing is Tiger Developments have disappeared, all my efforts at contacting them have be in vein. Oh well..

As to whether a multi-sync monitor or even a multi-standard TV would cure the problem? I don't think so, to me it seams as though the problem lies with the timing within the computers video display circuits. After all the computer doesn't know what its connected too video display wise, it just feeds out a signal which it hopes/assumes is being picked up by suitable equipment, thats if an Atari can hope or assume!!

I remember when having many games, I had a lot of problems with them.
All of those games were from Europe and I used them on US machine.
The games I remember had problems was H.E.R.O (flickering) and International
Karate - disk version (running faster, music faster). And there were
more but I don't remember. Now I have a demo which is supposed to be the
best ever produced for Atari 8 bit (digitized speech, cool music and
animation) but the pictures are flickering. There could be verions of
the games mentioned above made for 60 Hz systems and you probably have
them but it is just an example.

You are absolutely right.

It is not a big deal to get a computer from Europe. The problem is to get
a cheap multisystem TV or multi-sync monitor for that computer. Well,
perhaps it would also be cheaper to get a small TV from Europe as well.

3187. Atari 400 system FS in Chicago

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-11 00:00:00 UTC
From: mrt2@ellis.uchicago.edu
Message-ID: <D6vLw4.Kqp@midway.uchicago.edu>
Source record: 92628
Cross-posted to: uchi.forsale,chi.forsale,comp.sys.atari.8bit,misc.forsale.computers.other.systems

I am selling the following Atari 8-bit products (as a block, see bottom for
the gory details):

Atari 400 computer w/48K memory, owner's guide

Atari 410 Program Recorder w/manual
Cassettes: Eastern Front 1941 (w/docs, the original APX release)
Energy Czar (w/docs)
Kingdom (w/docs)
Galactic Chase (w/docs)

Atari 1050 Dual-Density floppy drive, w/owner's guide
Disks: Infocom's SUSPENDED (in original "big box", i.e., w/cool mask)
Sierra On-Line's ULYSSES & THE GOLDEN FLEECE (w/docs)
Electronic Arts' BILL BUDGE PINBALL CONSTRUCTION SET (w/docs)
Infocom's INFIDEL (in "original" packaging)
Infocom's HITCHHIKER'S GUIDE TO THE GALAXY (w/docs & toys)
Atari DOS 3 (w/manuals--Introduction to the Atari DOS
Atari DOS Reference Manual)
Cartridges: Pac-Man + manual
Asteroids + manual
Music Composer + manual
Star Raiders + manual
Demon Attack + manual
Pilot language + manual, ref. card
Super Cobra + manual
Assembler Editor + manual, errata sheets
Basic + ref. manual

Miscellaneous documentation from Atari, Atari Users' Group
Atari serial I/O cable (for use w/1050)
TV RF adapter ("computer/game" box)
3 Atari Joysticks, 2 Slik Stik joysticks

Books: "Mapping the Atari", Ian Chadwick
"Atari Basic", Albrecht, Finkel & Brown
"Advanced Programming Techniques for your Atari", Linda Schreiber
"Your Atari Computer", Lon Poole
"Adventures with the Atari", Jack Hardy
"Atari Sound & Graphics", Moore, Lower & Albrecht
"Dr. C. Wacko's Miracle Guide to Designing and Programming Your Own
Atari Computer Games", Heller, Johnson & Kurcina

Non-Atari Stuff: IBM PC Compact Printer (never used w/Atari, but someone might
be able to get it to work)

Note: of the 2 power supplies (one w/the 400, one w/the 1050), only one works; I will include both however. Also, whoever buys this gets the Missile Command cartridge manual FREE! :) (I don't know where the cart went, though)

Official stuff:

-I make no guarantees about how well/if this stuff works, it came from my parents' house this past weekend and hasn't been used in many, many years.

-I'd _really_ rather sell this stuff as a block, so unless you're willing to offer me some tremendous amount of money for one thing, please don't ask.

-If you live in the Chicago area and can pick this stuff up, great, otherwise I'll have to charge for shipping (most likely UPS)

-I'm going to do this auction-style; all bidders will be kept secret, but the highest bid takes it.

-Bids do NOT include shipping costs.

-Bidding will be ended on April 23, 1995 at midnight.

First bid at $75. Any takers?

That's not the only problem. PAL screens have more scanlines and therefore
display lists can be longer (measured in scanlines occupied) which causes
flickering on NTSC displays.

[...]

>It is not a big deal to get a computer from Europe. The problem is to get
>a cheap multisystem TV or multi-sync monitor for that computer. Well,
>perhaps it would also be cheaper to get a small TV from Europe as well.

If you do this, also keep in mind that the current differs. 110V vs. 220/230V.
You can probably get around this by using a US power suply on a European
Atari 8-Bit computer. (I assume that the output of US PS used in the US
is the same as a European PS used in Europe). Offcourse, the European TV set
also needs a 110V to 220/230V transformer...

On the same subject, I need to know if I'm right that if my TV can display
both 50Hz and 60Hz Atari 1040STE screens, it will also be capable of displaying
NTSC 60Hz output of a US Atari 8-Bit? The answer to the question if the
50/60Hz toggle of the ST also toggles between PAL and NTSC is also enough :)
(Hmm, I should be asking this on c.s.a.st too :)

Bye,
Ivo

I don't think you can do that. As an STE owner myself, I used this booting
program which will load even a self-booting games (used it on Silkworm IV
which had this stupid intro screen getting stuck and not letting me
further - with that boot prg it works) and if I connected my computer
to TV, the picture was scrolling up or down.
Again, as someone mentioned before, the output from 8 bit is like an
output from a VCR and try using US VCR in Europe (forget the speeds).
IT just wouldn't work unless your TV is multisystem which I doubt.

Also, it is Atari monitor which toggles between the frequencies!
Most of the programs/games detect the system automatically, that is
why you might think it will work for 8 bit.

Well I didn't know for sure about European machines, but I know for fact
that because they have more VBI time and they can code more inbetween it
causes flicker on NTSC machines.

: As to whether a multi-sync monitor or even a multi-standard TV would
: cure the problem? I don't think so, to me it seams as though the

It is in the video circuits. If they made the machine to only work with
a monitor and made a switching power supply then they could have done it,
but with that kind of money spent they would have committed suicide
against Big Blue.

This is quite a bit of money to invest in shipping, but I guess to some
it is well worth it. I guess you would need a 60Hz -> 50Hz AC power
converter as well, since it is the root cause of the problem.

One suggestion. Hook up your Atari to VCR. That will at least split
sound and video and you can work from there. I know you will have to
use VCR every time but it might be easier to make a converter for the
video signal than direct from computer.

To get the transformer is not a problem here. I've done it when I used
XF551 DD I brought from Europe. It was $20.

Hi everyone!

I need some info on tape decks. Someone is offering me Atari 1010.
I remeber having 1020. Was there such a thing as 1020? I remember
the one I had was the same color as XE computer. Is 1010 the old
one (made for XL) ?

Thanks

Byron; I'll admit I could be off a little on my estimate, but I'm guessing there's only maybe 2,000 active 8 bit users. I can't recall the exact percentage, but I think Ben @ AC said only something like 1/4 of the user base had access to some form of telecommunication. That leaves 500 people that can even hear the news there's a circuit available. Of those, I'd bet less then 1/2 even own an ST with monitor, let alone a spare one they'd want to leave hooked up to their 8 bit. I happen to have a spare one, & my intention is to hook it to a Jaguar. It's been my experience that most people are not really comfortable working under the hood of an 8 bit, less then one in ten would be a good guess. It's no big thing, I consider myself a little bit of a hardware guy, but I can understand others don't have the time or desire to take a soldering iron in hand. I'm *trying* to make the switch myself to design stuff that plugs into the 8 bit vs getting solder to the mother board just so I can find somebody to give stuff to rather then pulling parts & throwing stuff out. A lot of people just seem to prefer resturants over a home cooked meal<g>.

As far as I know, Atari sold two tape drives: the 410 (there were a few varieties of 410, but the color was the same as the 400 and 800), and the 1010 (same color as the 1200XL, 600XL, etc.). The 1020 looked an awful lot like the 1010, but it was a 4-pen plotter, not a program recorder.

If you've got to get a tape drive, definitely go for the 1010. I've had some problems with my 410, but the 1010 has performed flawlessly. Slow, but flawlessly.

>Would anyone be interested in plans to build an EPROM
>programmer that uses only 4 74LSxxx ICs and one joystick port?

Absolutely! I have Bob Puff's programmer, and it is completely
incapable of burning reliable chips when using 256's and above.
I'm having to use a different computer to burn ROMs, and would
love to get a new Atari solution.

>A question: how do you find all this time? The RVerter clone, the game
>Mr Fish, and now this?

I must have missed something here too! Do you have an RVerter
clone? I may need several of these also.

Message-ID: <1995Apr11.230218.5120@wariat.UUCP>
Source record: 92647

I've seen(heard) some people don't like the 80 column display of
Flickerterm. I've seen, oh maybe 3 or 4 people say they prefer Ice-T.
Well, I'm gonna say I prefer Flickerterm's display. I don't know if
this is because I'm using a monitor that displays it better or what,
but I find Flickerterm's 4 bit characters much more legible than the 3
bit chars. of Ice-T. This is not to put Ice-T down at all. I'm
greatful we 8-bitters have two, count 'em, two new 80 column term
programs. Thanks, Mr. Halliwell for Flickerterm. (Also, it is free, as
far as I remember, whereas Ice-T is strongly shareware fee type.)
(But, actually I don't use either, I use a 80 col XT with Procomm
Plus.)

: Hmm ... This brings me a little question. I know that NTSC 2600VCS
: carts won't run on PAL systems. Is the same true of Atari 8-bit
: carts?

: Actually, I guess not since people do import carts from the States.
: Anyone know for certain?

Well, I've never seen any specifically PAL carts for the 8 Bit Atari, and all
of mine seem to have US stuff in them. Mind you, so does my PAL 800XL, my UK
1050 etc etc....

That really p****d me off, all the guarantee cards had US addresses on them.
Did Atari assume all their users lived in the US or Canada?

Nowadays, I have nothing but contempt for Atari- they have done nothing to
deserve praise, and if their had been any justice, they'd have gone down with
that other pile of **** Commodore. At least Atari owners have less to lose
if their company goes down- C= were still selling the Amiga (we all hoped there
would be a buy out soon after), but Atari only sell machines for about 2 weeks
these days, then bring out something else which also fails miserably...

What the world needs is a new age.
What the world doesn't need is New Age.

Just a note: if you do see multiple postings on usenet (not in the digest, though) save copies and send the headers to your newsadmin. Mine is looking at the problem; it's happening in a number of groups. My guess is that as the 'net continues its rapid growth, teething problems like this will increase.

: for 80 cols on the atari 8-bit. sure, it has some drawbacks, but but for
: crisp legibility of the letters, theres nothing better.

: i dont even KNOW how you people use flicker term. <shudder>

Ice-T is blit blit blit and blit is slow, no matter what you do.

For anyone with a 14.4, FlickerTerm is the only way to go either you will
waste time online waiting for screen redraws.

If someone is at 9600 or less I guess Ice-T is the way to go. I think it
maxes out around 9600 (which is the fastest blit so far--the oldies
barely did 2400).

Yes, XC12 was the one I had. Any ideas where to get one? Anybody?

Hello.
Anybody familiar with .MSA compression on ST? Is there anything like
that for the 8 bit?
Thanks

Vladimir

3219. 1010 & 1020

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-12 00:00:00 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <16EB2460FF9@east-01.novell.leeds.ac.uk>
Source record: 92565

The 1010 was a data recorder, but the 1020 was a four colour (color depending on who you are) printer/plotter. They both had similar cases and where styled cream/brown to match the XL series of computers.

I suppose when I say was I really mean is, since there are still many of them in use and I don't think Atari has sold the 'copyright' on the number as they did with the 400 (to IBM I believe)!

In the UK the 1010 was notorious for having weak buttons, usually the play button snapped after several months use.
Other data recorders include the 410 (two versions, one with and one without a pause button), PHONEMARK (not made by Atari), XC11 which only lasted a few weeks and XC12 which is basically a Phonemark but receives its power from the computer.

SpartaDOS X, is I believe available from Fine Tooned Engineering priced at around $50, e-mail ftooned@delphi.com for more details.

Finally I would just like to point out Tube Baddies and Black Lamp are now ready for shipping. Anybody who has placed an order, your copy(s) will be mailed as soon as possible after this saturday.

>

>(But, actually I don't use either, I use a 80 col XT with Procomm
>Plus.)

Actually, we have two machines, the 800XL and a 486/33 Windoze box. Usually I use the 486 for my on-line stuff and certainly for surfing the Web. I rarely use the 800XL for communications except for (a) file transfers and (b) when my wife is using the other machine.

Question for those in the know: Does FlickerTerm look much better on a monitor with split video than it does on a regular TV? (I hope)

I have the complete hint book for Alternate Reality, The Dungeon along
with the full size maps to the game, I bought these things years ago when
I first got the game because it was just too hard to play. The book tells
you EVERYTHING you need to know about the game and came right from
Datasoft. The maps show all secret areas and where the monsters are at.
This was the second adventure game I ever played, the first was
AR the City, and I still consider it one of the best I ever played right
up untill today. I dont know what it was but you thought you were right in
there with the dungeon denizens!
I wont sell the orginal copy of the book but I will make a quaility copy
of it and the maps
for 10 dollars. I also have the six page hint booklet for AR the City.

"Does FlickerTerm look much better on
a monitor with split video than it does on a regular TV?"

ANYthing using thin pixels in high-res (320 across) mode will benefit
from using split video (chroma/luma; all you need is luma, and that's all
that most 8-bits put out without hacking (btw, I want this hack!)),
so both FT80 and Ice-T should look at least a bit better than normal.

As for the flicker, I've found that with my (current busted <sigh>) C=1084
monitor, that things like APACView and ColrView look a LOT nicer when you
turn the contrast way down (the flicker can sometimes almost disappear!)
so I'm sure that FT80 should look VERY nice if you do that on top of using
split video. I don't recall ever having tested this. I WOULD be testing
it soon, except the fact that:

1) My SX212 which I just got back does NOT work with Atari's at all..
Back when I fried my XMM801 printer, 1200XL and probably to a degree
one of my 1050 drives, I guess I killed my SX212. I couldn't test it
because I had only the 1200XL's to test it on. It DOES however
work with my friend's Amiga and my PC.

2) My P:R:Connection still needs a modem cable! (WHY are they not
standard!? Argh!) Someone is supposed to be sending me one, but...
it's taking a while. Oh well.

I'll have to (finally) resubscribe to _AC_ and get some back issues and
what-not to see some PUBLISHED reviews.

I'm much more the video game buff and I like some of the cartridges available on the 400/800. I'm willing to trade the following for games I don't have. I don't presently have these items w/ me, but I can get them in a month when I return home. If there is any interest I would like to make a deal before then.

1050 Disk Drive: MINT, orig box, instructions, travel inserts, boxed power supply, even silica gel is in there.

810 Tape Deck: MINT, same as above, just like new

800 Computer: Again barely used, no box but has orig styrofoam, unopened manual, no RF switch but have the cardboard box, basic, etc.

??? The thing that lets you hook in serial cables w/ power supply, tan

1010 (?): 4 color plotter, don't know if it works as I have no software, orig p/s

Some educational software, I remember having fraction action w/ orig box.

Any offers, I'm not so sure I want to trade away, but I'm always willing to listen, especially for the serial cable thing, the plotter, and the 800.

-alex atoth@vax.clarku.edu

(I forgot, the only carts I have now are: Qix, Miner 2049, Fast Eddie, Caverns of Khafka tapes, Zaxxon [will trade this too], pacman, star raiders, I think thats it)

3235. Hello

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-13 00:00:00 UTC
From: mbrown@ersys.edmonton.ab.ca
Message-ID: <Xg1i4c2w165w@ersys.edmonton.ab.ca>
Source record: 92576

I just wanted to post a little trivial information about my Atari past and ask a few questions about the current Atari 8-bit situation.

I've owned an Atari 800XL since 1985 and have also owned an 800, 600XL and a 30 megabyte hard drive/MIO combination at one time (I since regret selling the hard drive and MIO).I still enjoy playing a few games on my 256K 800XL with a US Doubled 1050 drive. My kids enjoy the older games as well (definitely easier for the younger kids to figure out than the more complex games found on my PC and Mac). I used to collect the Antic and Analog mags/disks (now since gone I hear).

So, my questions concern: ICD?! What's happened with them and are their products available anymore?

OSS: I've got the MAC/65 and Action! carts (both excellent), but I would assume they are also no longer available...

How often is a FAQ on the 8-bitters posted to the newsgroup?

Well, it's good to be back in touch with the 8-bit crowed - it was my first real computer and still holds a special place inside.

Up The Irons!

I also am trying to get a good RGB hack going and I have found that SC1224's are cheap and plentiful. It's just that GTIA's chroma output is so hard to accurately measure for the purposes for 'cleaning up' the signal. A hack that just puts the composite picture on an RGB monitor isn't worth it to me. One that makes the 8bit look like an RGB computer would be. Anyone got a GTIA schematic? :)

Okimate 10 thermal color printer for Atari computers in original box with one black ink cart and three color carts, two still in there boxes. Makes great color pics but it is slow. Comes with cables, printing software, and some thermal paper. This will also work on Commodore 64 computers if you have the right printing module. 65$shipped. I also have a TON of Atari software of every sort and and allot of the old Atari magazines and their software. Drop me a line if your looking for something hard to find and I'll be happy to see if I have it for you.
thanks,
Jgem

3238. Binary Load/Hardware Compatibility

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-13 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <3mhvrj$eec@dartvax.dartmouth.edu>
Source record: 92579

I was thinking the other night about the problem of some binary load programs being incompatible with some systems based on OS revision, CTIA, etc., and came up with a cool idea.

First some background:

Am I correct in understanding the binary load format in that you can, at any point, include an initialization vector that the load routine will JSR to before loading the rest of the program? And you can have multiple initialization routines?

If that's correct, then you could prepend an initialization routine to any binary load file that checks the OS revision, available memory, cartridge status, DOS version, GTIA presence, etc. This could be compared with a list of known incompatibilites for the program, producing error messages for problems. It could even check the return address from the JSR to get an idea if the load routine is going to be overwritten by the load, triggering a crash. If it's really clever, it could see what sector was last read and take over the load itself if a conflict is detected.

The big problem is that this makes all the load files larger. One solution would be to provide a program that removes the compatibility tester--it wouldn't be too hard to do, if it was done carefully. For those of us using SIO2PC, the extra space consumed on our hard drives isn't that significant.

So is it feisable?

I personally swear by Flickerterm. Its VT100 is better than any PC implementation I've seen, it has only one problem at 9600 (scrolling messages of over, say, 6k make it start to drop a few chars) and is tiny compared to Kermit. I only keep kermit around because the system I use only supports kermit and zmodem for uploads... and there's no atari8 send zmodem yet.

Yes, though I still believe it looks best on my mono Magnavox80. Next best
seems to be a split video monitor (with the color turned down...if its color).

I believe there is a hardware memory location labelled "PAL" which determines whether you are on an NTSC or PAL *Atari computer*. I'd have to check properly on the details but I am certain that this is in Mapping The Atari.
This isn't a cure but you could conceivably program your timing on the basis whether you have an NTSC/PAL computer assuming you'd have 60/50 Hz correspondingly.

A PAL ST can show 50 or 60Hz, but _not_ NTSC. If it suddenley switched to
NTSC when changing to 60Hz, then I wouldn't be able to see it on my TVs.
AFAIK, there's more to the difference between PAL & NTSC, than just 10Hz.

I've had 2 XC12s. I remember that there was a small default with the
moving part in which the cassete was inserted. The piece, which locked
the compartment with tape in it, locked a little bit higher than it was
supposed to, causing it to look like it was slightly open. That had an
effect on loading accuracy. In the few days I had to load games using
a regular speed tapes, I had to put a heavy book on top of the player to
close it better. Many people fixed that problem by adding a little plastic
piece so the cover had to be lower to close. With Turbo installed it wasn't
a problem at all.

dfazio@MR.Net

Hang onto your Packets: The Information Superhighway heads to Valleyfair
or
Building a high performance computer system without reading the instructions.

March 14, 1995

Preface:

We are now in the midst of an immense transition on the Internet: The implementation of a new structure that has been in the making for several years. It was publicly mapped out two years ago with the release of a solicitation for proposals by the National Science Foundation (NSF solicitation 93-52) for four separate components of a new American national backbone architecture. The effects of this transition will be felt over the next few months and repercussions of it will evolve over the next few years. There is a potential for profound effects on the immediate needs and requirements of all MRNet members and subscribers: namely, stable and reliable Internet access. Because there may be difficulties and disruptions in these services and many periods of wild ups and downs (not all that different from a roller coaster ride at the nearby Valleyfair amusement park), I am writing to give you some background of how we arrived at this point and what might be expected in the near term.

This description will be part history and part personal observation. It is not intended to be a comprehensive scholarly description, but rather my observations based on watching things over the past year or so and some recent events that have confirmed some of my fears and also my enthusiasms.

Ancient and Recent History:

The Internet, as we know it up to this point, has a long history (in technology industry terms), going back to research with the ARPAnet and introduction of the first early backbone to connect the NSF sponsored

supercomputer centers in the mid 1980s. The core of the national Internet we are all familiar with had its start with the awarding of a 5-year cooperative agreement in 1987 to Merit, the Michigan state networking organization, and its partners MCI and IBM. This was to provide a national backbone network service with a bandwidth of 1.5Mbit/sec, and several access points around the country. Merit provided the expertise in managing a network service, including routing, IBM provided the core backbone routing equipment and MCI facilities were used for the trunk lines.

This system was originally research and education based and mostly higher education institutions and research corporations were the users. A system of regional and state networks (like MRNet) grew up around this core and provided access to the user organizations in their areas. Most all of these regional networks were nonprofit public-service based organizations that had grown out of major research universities.

The popularity of the system grew at a steady pace, primarily with financial help from the National Science Foundation, championed by the director of the NSF Division of Network Communications and Research Infrastructure (DNCRI) Steve Wolff. DNCRI provided funding to higher education and regional networks to help with connectivity. The system evolved into an orderly structure of a high-speed backbone (the NSFNET backbone service), mid-level networks and campus and corporate networks where the end-users were attached. Routing and management was centered at Merit and policies and procedures evolved for the smooth operation and growth of the system.

As the popularity of such a system increased, some people saw it would be worthwhile to provide access to this system as a business opportunity. Entrepreneurs, with experience gained from regional network operation or similar networking services provision, established new businesses to get in on a new opportunity. The first generation of these were Performance Systems International (PSI) which was spawned out of NYSERNet in New York, and Alternet, a service of UUNet Technologies in Virginia, which had considerable experience in UUCP network services among others.

In 1991, the Merit/IBM/MCI partnership was reformed with the creation of a new nonprofit corporation, Advanced Networks and Services (ANS) in which the founding partners entrusted the operation of the NSFNET backbone service. ANS formed a for-profit subsidiary, ANS CO+RE (Commercial + Research&Education) to offer full commercial traffic on its backbone. This was somewhat controversial, since ANS had the advantage of the NSF subsidy of about $10 million/year to operate the NSFNET backbone service. The concept of NSF-sponsored research/educational-only traffic and commercial traffic running on the same wires was a difficult concept for many to accept and ANS was considered to have an unfair competitive advantage over PSI, Alternet and now Sprint (who was also entering into the commercial backbone service). This resulted in much discussion on several mailing lists, self-appointed crusaders for justice, an Inspector General report and a congressional hearing. None of this had much of an effect on anything in the end, however.

Plans were underway at that time to upgrade the NSFNET backbone from its T1-based (1.5Mbit/sec) bandwidth to a T3-based (45Mbit/sec) service. This required new designs in routing equipment and interfaces and the transition was a somewhat lengthy one, stretching over several months with some degree of technical difficulty, since setting up a T3-based high-performance backbone service with high levels of production traffic was, at that time, on the leading edge of technology. There were a number of small disruptions in service as the network stabilized and Merit and ANS learned how to deal with these new technologies and rapidly growing levels of participants and traffic.

However, there was a critical advantage to that transition, in that it was being designed and engineered by people who had considerable experience in operating such a system, and the new service would be provided by those same people. There was no handoff to any new organizations. The same group operated both the T1 and T3 backbones during the transition and the T1 backbone was always there as a fallback (though its ability to actually handle the traffic load was lacking at that point).

As the five year cooperative agreement period advanced to its conclusion, the NSF engaged a small team to come up with a new agreement or set of agreements to bring the national backbone system into a new structure. The NSF observed that its sponsorship of the backbone service, once considered an area of advanced technology and research, was now operating as a commodity service with several commercial networks in place. The NSF was set to move on to other advanced network technology projects and worked to come up with a way to withdraw from the established networking services and allow the commercial free market to carry on. However, NSF did have a responsibility to the educational and research activity it had been sponsoring for so long, so it did not intend to just walk away. Rather, it worked to come up with a scheme to facilitate an orderly transition to the new system.

The coalescing of this scheme was a lengthy process and considerable public input was solicited, especially from the mid-level network community. This resulted in the publishing of a solicitation for proposals. It requested proposals for four areas that would comprise the new national Internet structure:

1. NAPs - Network Access Points.

The NSF proposed to sponsor a number of exchange points where national backbone providers (also called Network Service Providers or NSPs) could meet and exchange traffic. The NAPs would fulfill this function, and were intended to be a level 2 service; i.e. they would operate at the data link layer and carry the network layer (TCP/IP) traffic that was managed by the backbone operators who connected there. The idea behind this structure was to establish a limited number of interconnect points for the commercial backbones. NSF's stake was to guarantee full connectivity for the research and education community. Without the sponsorship of a core set of meet points, backbone providers would likely set up a hodgepodge of bilateral connect points, potentially resulting in routing chaos. The NAP operator is to provide the exchange facility. It is up to the individual NSPs that

connect to the NAP to work out bilateral exchange agreements with the other NAP connectees.

2. Routing Arbiter.

This would be an independent organization that would operate route servers at each of the NAPs. These servers would contain the database of routes to ease the transfer of traffic among the backbone providers that met at the NAPs.

3. vBNS - Very-High-Speed Backbone Network Service

This would be the one new backbone network that the NSF would sponsor. It was intended to be a leading-edge research network operating at a minimum bandwidth of 155Mbit/sec with later upgrade to 622Mbit/sec. There would be a strict acceptable use policy on this network: It could only be used for meritorious high-bandwidth research activities. There could be no production traffic such as general file transfers, remote logins, Web browsing or email. That was to travel on the commercial backbones.

4. Inter-regional connectivity

These would be a series of awards made to the academic regional networks (the group that built the original Internet). Since access to the ANS-operated NSFNET had no gateway access charge, there would be a large expense shock to the regional nets and their clients when they now had to pay hefty access fees for 45Mbit or above gateways onto the commercial backbones. The NSF proposed to award the regional nets a subsidy, declining to zero over a four year period, to ease the transition to higher fee levels or growth that would support the costs of commercial backbone access.

Many organizations spent the summer of 1993 responding to this solicitation and by August of that year, they were all in. Independent review panels made recommendations to NSF staff and in February of 1994, the first series of awards were made:

1. NAPs

The NSF awarded 3 priority NAPs. One in the New York area, one in Chicago and one in the San Francisco Bay area (California NAP)

a. The NY NAP was awarded to Sprint, who proposed an interim FDDI ring with routers, to be substituted by an ATM switch when they felt the technology ready.
b. The Chicago NAP was awarded to Ameritech and Bellcore. Ameritech is the Regional Bell Operating Company in the Great Lakes area. Bellcore is the research arm of the Regional phone companies. Ameritech proposed to install an ATM switch system using an AT&T Globeview-2000 switch.
c. The California NAP was awarded to Pacbell and Bellcore. Pacbell also proposed the immediate installation of an ATM switch system using 2 Newbridge 36150 units.
d. A fourth semi-offical NAP, called the DC NAP also is being put inplaced. It is built and operated by Metropolitan Fiber Systems (MFS) in the

Washington DC area. MFS is evolving its facility from its current Ethernet meet point, to an FDDI system.

2. Routing Arbiter

This award went to a joint team of Merit (the routing manager of the current NSFNET) and the Information Sciences Institute (ISI) of the University of Southern California. ISI will do most of the work on routing management systems and Merit will implement the route servers and route server database.

3. vBNS

This award went to MCI, who is implementing this service now as a 155Mbit/s ATM service. Connections to the five NSF-sponsored supercomputer centers and the NSF priority NAPs are under way and service is expected to be available by April 1, 1995.

4. Inter-regional connectivity

A series of awards was made to several regional networks who chose Network Service Providers (NSPs) to carry their traffic to the NAPs and other backbones. Most (7-8) of the regionals chose InternetMCI. Two or three chose SprintLink and one chose ANS.

Now What:

This brings us to where we are today: Smack in the middle of the transition from the old NSFNET to the new structure. You will notice that this moves the national structure from a primary R&E T3 backbone with several growing parallel commercial backbones to a more complex system of multiple commercial backbones with major exchange points. Previously, the ANS/NSFNET was really the center of the national Internet. There will no longer be a single national central backbone; indeed, traffic on the current T3 ANS/NSFNET would soon be reaching the point of saturation. There is no current production technology that can provide a single replacement network backbone to carry the required traffic.

What, Me Worry?

You may notice that this newer complex scheme has no single authority overseeing the implementation. The success of the construction depends upon the mutual cooperation of multiple phone companies, (both regional (Regional Bell Operating Companies or RBOCs) and national long-distance (IntereXchange Carriers or IXCs), Academic and commercial research institutions, equipment manufacturers and regional network providers. The National Science Foundation does not see it as its role to manage the new national Internet structure. Merit is responsible, via the existing cooperative agreement, for the smooth running and handoff of the existing system, but not the management of the building of the new structure.

This new system is a massive complex assembly of components and subsystems that must be put in place by multiple independent organizations, most of them fierce competitors of each other, on a strict schedule (funding for the

existing NSFNET terminates irrevocably on April 30, 1995) AND THERE IS NO PROJECT MANAGER.

There are also potential sources of problems in the implementation of the components by the major players. The greatest risk comes at the NAPs. A NAP is really a high-performance computing system, with multiple I/O channels, sophisticated hardware and software, and a need for operational procedures that are well planned and understood. I used to be involved in the design and development of high-performance computing systems and there were a couple of fundamental axioms you followed if you didn't want to fall flat on your face:

1. Don't change technology and architecture at the same time. The developmental risks of trying to do two major things at once is too great.
2. Build a prototype that you plan to discard. This is required of any major systems development project, either hardware or software. The rule is, plan to build a prototype, because if you don't, you will end up building it anyway; it will be called version 1.0 or model 100 and will be a lot more expensive.

Half of the NAP operators violated these axioms. There is a major architectural change in these new systems. It will take the NAP operators time to figure out how to manage a major switching system with multiple high-bandwidth backbone operators depending upon it and pouring traffic into it. It will also take a while to work this into the grand new national system. This is the architectural change. The NAP operators may potentially have to deal with new technologies to implement the high-bandwidth needs of managing the exchange of such large volumes of IP packets. This is the technology change. There is also the issue of inexperience. With the exception of MFS, none of the NAP operators has ever done this kind of thing before.

MFS, in DC, has some experience at managing a meet point. It has operated the Metropolitan Area Ethernet in the East (MAE-East) for a year or two. This is an informal exchange point where most of the NSPs meet to exchange traffic. They have chosen to build on this experience and expand the technology from Ethernet to FDDI, not a great technological leap. This is a fairly safe approach.

Sprint, in NY, has never operated a proto-NAP, but will learn how. It has chosen to implement the new architecture, but build a prototype out of current technology. They will then migrate it to ATM after experience is gained at both NAP operation and when ATM technology is more proven. They are building a prototype.

Ameritech Advanced Data Services in Chicago had determined that it doesn't need a prototype and was going to use ATM from the start. Ditto with Pacbell in California.

Well, it turns out that there are problems with both the ATM technology in a high-bandwidth high-volume production application and with some of the

interface equipment required to be used with the ATM equipment. (Surprise, surprise - a new unproven technology has some kinks yet.) Ameritech, at the last minute in January decided to build a prototype after all and ordered an FDDI ring and some Cisco 7000 routers to build a limited prototype.

Pacbell ran into the same problems, but planned to blast on with its initial plans, convinced that they would make it work in time.

OK, Everybody Jump:

Beginning in Dec '94 and throuth Jan-Feb '95, most of the regional networks began to move their traffic onto their new NSP backbones. The problem was, the NAPs weren't fully ready. MAE-East, a 10Mbit ethernet, for a while became the center of the US Internet, since it was the only working meet-point for a large number of NSPs. Fortunately, MAE-East evolved into MAE-East+, an FDDI version, more capable of handling the traffic volumes.

As of this time (mid March) the Chicago NAP is still not operational. The Pacbell NAP had already been written off as a reliable exchange point by most. The Sprint NAP is up, but not everyone is connected there yet. The key players, MCI, Sprint and ANS are, however and traffic between the MCI-connected regionals and Sprint customers is traversing the Sprint NAP. Traffic load through it is high because of the lack of operational status of the other two NAPs.

Since, in January, Pacbell was still planning to go ahead with the ATM system which many were convinced would not work, and not build a prototype, the manager of the NASA Science Internet decided to build one for them. NASA is installing a DEC Gigaswitch at its Ames facility and inviting any NSP or other entity to wire into it. It will be called MAE-West. This will provide a critical exchange point for the west coast. Most of the western regional networks are sending traffic to the east coast for exchange onto other backbones. Packets from one Seattle company to another can travel to Washington and back to reach their destination; not an optimal situation.

Pressure was brought to bear on Pacbell, and I believe they have agreed to install FDDI equipment to finally construct a prototype. How this now fits in with the new MAE-West is unclear.

So, When Does the Ride Start? Are we gonna crash?:

The transition is underway now. All MRNet traffic now travels via CICNet infrastructure onto the InternetMCI national T3 backbone. Within a month or two, our traffic will travel directly via T3 link to InternetMCI. Traffic to SprintLink, PSI, Alternet or other customers transits the exchange points, which at the present are either MAE-East+ or the NY NAP.

Over the next month or so, we are likely to see the Chicago NAP come up and the MAE-West facility come up. The Pacbell NAP may also be working within a short time also. These new exchange points will take a lot of pressure off the few exchange points now working.

The primary reason for this long background and explanation is to let you know that there are likely to be disruptions in Internet service, either regional or national, that will affect your operations. It is important that you realize this and be prepared to cope with it. There are things beyond MRNet's control that will occur as these systems come together. These problems will be either partial or total as the systems come online and start carrying heavier traffic loads. There are likely also to be disruptions on the major NSP backbones as they become accustomed to carrying such large production loads. None of the equipment now in place has ever been put in large-scale use under such heavy traffic loads. The people who are operating these facilities, in some cases, are new at the job. The transition is not complete and a lot is yet to come as the NSPs, NAPs, Routing Arbiter system, etc. gets put into place and shaken out.

As you can see, there is an immense potential for disasters all over the place, with no project manager, NAP operators who are inexperienced, NAP technology that is not ready for prime-time, NSPs who have varying levels of experience, network routers that are being stressed into new performance territory and several other trip points. However, all is not dark. This is, after all, the Internet - a system that grew up on lack of central authority and management. Indeed, the fact that we have traveled this far into the transition with only minor derailments is very encouraging and we will probably come through in the end with only minor scrapes and bruises.

There are a lot of new people, but a lot of the people who built the Internet as we now know it are still in action and providing expert guidance. All players from the smallest state networks to the largest phone companies have a lot at stake in success. The Internet is a critically important resource and it will be made to work because so many need and want it to work. The mutually beneficial unmanaged cooperative culture of the Internet is strong (use the Force, Luke) and even the new players are moving according to its informal ethereal containment fields.

Designers and operators have broken the rules about project management and system development, and the technology is quirky and unpredictable. But it is somehow coming together. It will likely be a rough and bumpy ride, hence the whimsy of the title of this article, and we should be prepared for that. It might take six months to a year to feel a new sense of stability and reliability, but it will be worth it. This new structure will provide a new basis for the growth of the Internet that we may not be able to imagine yet. If you are willing to hang on with us, we'll do our best to get you through.

If you have any questions or would like additional background details, please write or call me directly or contact any of the MRNet engineering staff.

Someone was asking about the actual cheat code to get Advanced Music Processor to pop up in 32X Star Wars Arcade. Well, here it is:

Pause the game anytime during play:
Timer Reset - Left, Down, A, C, Down, Up
Freeze Timer - Down, B, B, Up, Right, Left
Piano Mode (Sound Test) - Up, Right, Left, A, Down, C

Note: These codes require a 6-button controller, because there is no way to pause the game on a 3-button controller (ahh, those guys as Sega are regular geniuses, ain't they?).

Could someone send me a copy of Advanced Music Processor (NOT "Antic Music Processor")? The only AMP programs I have are an assortment of hardwired player programs ("Passionately", etc...). I'd like to send a screenshot to the magazine that originally published the cheat.

Where? My 130 XE has one output to TV and one to monitor. Well, if
you use the one for monitor than perhaps you are right.

The mortal Andrew K. Heller wrote:

: I always used Kermit65 in 80 column mode. are any of the new programs
: better than this?

Even Kermit will lose characters at 2400 after more than a screenful of
continuous text.

I think anyone over 1200 baud should consider Ice-T and anyone from 9600
on up should consider FlickerTerm.

I know a lot of people get turned off by the flickering, but FlickerTerm's
font is more readable. Things like 8 and 0 are a lot easier to
distinguish with 4-bits... And not only is FlickerTerm useful for VT100
but also for ANSI calling as the font is the IBM subset, such that most
character graphics come through well, and the novel use of PMGs! for a
bold-mask is nothing short of genius. Clay deserves credit for breaking
the speed barrier open on 80 collumns, essentially getting from 75-90% the
text throughput that Bobterm can do. This was definitely solely needed in
this day and age of dirt cheap fast modems.

Those who thought you couldn't drive 80 collumns beyond 2400 were proven
dead wrong. Ice-T is also an acheivement, but blitting will always have
an upper threshold in throutput which is lower than that of textmode writes.

People should also realize that prior to the flurry of activity on this
front, there was next to no development of 80 collumn terminals for the
Atari. These programs really were necessary not only to fill a gap, but
to prove that the Atari8 still had power which creative programmers could
get from it--where others had not.

A couple things. I left K65 as also another new 80 column term. It has kermit protocol, but somebody said it doesn't work so great above 1200 baud.
Bill, I think you and I discussed closing ALL channels before any possible exit from a program. Especially with ACTION! and SpartaDOS. I told you one of my programs (in ACTION! I think) trashed Tom Hunt's hard drive. Now this has happened to John Harris's hard drive. So Bill, did you make ABSOLUTELY certain you didn't leave any channels dangling open?

>I'm sure there are more I don't know about. When I hear about 250,000
>line applications...yikes!

Absolutely! :)

Which brings up another point. With programs that big, it becomes
a necessity to have programming teams, rather than lone virtuosos. This
not only leads to more bugs, it decreases the quality of the product in
other,more subtle ways. Any time you have a group of people together, you
get group dynamics operating. That means, among other things, that
someone(s) is going to dominate, and others are going to submit. This
in turn means that some good ideas are not going to be implemented,
simply because of the position in the group (dominant or submissive) of
the person who suggests them. Still others won't be suggested at all,
for fear of rejection and/or ridicule.
yet another problem of the "bigger is better" syndrome in
commercial software . . .

I dunno if this is what you meant, but I'll mention it just for
clarification just in case anyone other than myself got this impression
from your statement above:
ROT13 works the same backwards and forwards. If one program
rotates forward in the alphabet 13, the recipient's program could rotate
it forward OR backward, and still get the correct original letter . . .

Glad you have it running! :)
As for the readability, perhaps it is just my particular setup,
but this works very well for me: Follow the instructions about using
low lighting (I have a 40-watt bulb inmy desk lamp, and if that is the
only light in the room, that works well), then set the background
to blackest black, and the foreground the the lightest (yet still
readable) white. The flicker disappears! :)

All this back-biting over 15-year-old atari warez piracy is just plain silly. Software piracy as a semi-organized institution/ practice has been going on since the first 2 people in the same area code got compatible computers. Right now, Mac and PC piracy, on boards, on the net, and everywhere else you can think of is running rampant and there is no way to stop it. These systems, which have millions of users pirating software might actually be hurting the software industry. The last 3 or 4 remaining atari-8 warez boards certainly are not.

Let's get real here. The church stopped giving mass in Latin in 1965 and atari dropped 8 bit support in 1992. The 8 bit is as dead as Latin and it won't 'rise again'.

The least we, as museum curators, could do is to create a library somewhere with ALL the cracked 8 bit games, and all the apps so that anyone wishing to reminisce about the past for a moment can do so in some luxury.

Another argument altogether is the preservation of the machine and its code for the sake of history. Just like in M.U.L.E. when the store buys your antique computer for $200. When the last atari 8 bit pirate dies, and his children don't even realize they have to hook up his ancient computer to a TV, the entire legacy will die and nobody will remember. In three or four hundred years liberals will curse humanity for letting all this software, all this history and knowledge go to waste.

Just think how much it saddens you when you hear about great masterpieces being destroyed by barbaric assaults etc.. This is now happening to all the old games we loved so much back in the Reagan years. Is it in anyone's interest to see this pirated software extinguished? How many classics have been lost forever already?

Legal or not, I stand in support of liberation for all atari 8 bit warez. If nothing else, I implore anyone out there who is reading this to maintain your library of warez in a fashion that will be as permanent and long lasting as possible.

Long live the king!

Sorry I wasn't so clear. By "way" I didn't mean "direction", just
something wrong somewhere in the translation algorithm. (is rot13
sophisticated enough to be called an algorithm?)

Hmmm.... the Tao of Rot13....

In a message dated 4-9-95, Byron Followell said:

"However, I do agree that it would be a fairly complex
circuit with a fairly long development period."

Actually, there was a issue of Modern Electronics from a few years ago that had an article detailing a composite to analog RGB convertor. One of the first stages of the circuit split the composite input into chroma and luma signals, meaning that stage could be eliminated for use with the Atari 8-bit.

At the time the article was published, the estimated cost of the completed convertor was around $90, as I recall. Whether the cost of the components has decreased significantly in the interim is another matter.

From: bmarcum@iglou.iglou.com
Message-ID: <D71AIA.EL9@iglou.com>
Source record: 92514

Since the 1200XL does not have a PBI, the easiest way to add a hard drive is by using an IBM compatible computer and an SIO2PC cable (see the FAQ for more information). The 1200XL, like any Atari 8-bit, can have up to 4 floppy drives; they can be Atari 810, 1050, XF551, or various third-party drives. You can have a tape drive in addition to floppy and hard drives, but you probably won't want to use tape unless you have a favorite game that isn't on disk or cartridge.

You have been out of touch for a while! :) ICD bought the rights to OSS software several years ago. Then in 1992 or 93, ICD decided to stop making any products for the 8-bit computers. Just a year or two ago, Fine Tooned (ftooned@delphi.com) acquired the rights to the ICD and OSS products, and began developing some new products (see messages in this newsgroup about MARS8, MIO II, and Sweet 16). Fine Tooned also released a shareware version of Spartados 3.2, and they sell the Sparta X cartridge developed by ICD.

From: rlcolli@ibm.net
Message-ID: <HGtjvQ7YaKZd083yn@ibm.net>
Source record: 92516

After not using my 8-bit for the past 3 years, I'm ready to put it back into service. I've just moved into a house that has enough room so I can set it up right beside my 486DX2-66.

I need to ask a few things first:

- I purchased an Action! cartridge a while back, but it didn't come with any documentation. If any one could point me to some docs (especially reserved words and their uses) I would much apprieciate it. Also, if anyone knows of some good tutorials on using it, that would be great too. I'm a proficient programmer in Atari basic, and I know Pascal, which seems to help a lot in the little I've done in Action!

- I was think about building the SIO2PC myself, but after buying the parts, I realized that it is a project that is a *little* above my skill level. If anyone could volunteer to build me one, I would make it worth their while. I do have all the parts.

Well, that's it for now, and I hope to hearing from someone!!

TIA,

Thanks to those who responded to our original posting under this topic.
It was a greater interest than we had expected. Now, for those who did
not happen to see it, but might be interested, here is a list of what
is still available. If you know of others that might be interested we
appreciate your passing this list on.

A

New Atari 8 bit software

COMPUTER GAMES PLUS
1839 E. Chapman Ave.
Orange CA. 92667

phone (714) 639-8189
fax (714) 538-1707

email aturco@netcom.com

Who are we? We have been Atari dealers since 1980. We started with
Atari 8 bit. Our first ads were in Antic and Analog magazines, and in the
beginning we were solely a mail order company. We now have a retail store too.

The merchandise listed here is all NEW unopened inventory that
has been in our stock since release. These titles have had various
price reductions through the years, and we have again reduced them
for this list. The prices reflect quantity on hand. The more expensive
titles are probably our last copies.

We hope you find something of interest.

$15 -disk- Anti Sub Patrol (Rocklin)
5 -cart- Basic Computing Language (cart only) (Atari)

payment: you can pay by check or charge card (Visa or Mastercard). If you are going to send a check please send email first and we will confirm that the titles you want are still in stock. We will then hold them for one week for your check to arrive. Please expect a two week delay for check clearance before your order is shipped.
If you prefer to pay by charge card you can call your order in or send the charge card info by email. If you are going to use email we need the full card number and the expiration date. And, of course, give us your shipping address and phone number.

There is a single shipping charge of $5 on all orders within the United States. If you are outside the USA we will quote you actual shipping once we can confirm your order. We can ship anywhere.

3275. The DEMO version of F.R.E.E. is available! NEW!NEW!NEW!

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-14 00:00:00 UTC
From: bleroy@ccr.jussieu.fr
Message-ID: <1995Apr14.103634@ccr.jussieu.fr>
Source record: 92603

F.R.E.E. is a new graphic adventure game.
It features a hundred full-screen graphics 15 beautiful drawings, five disk sides filled with text and images, a menu and windows based user interface (95% of the game can be played with the joystick), automatic mapping, etc.

And you can have the first two disk sides of F.R.E.E. for free (ha!ha! Very funny)
Just send a mail to
bleroy@moka.ccr.jussieu.fr or fabien@ssnet.com
Or look for it at your favorite FTP site. I will try to spread it as fast as I can, but your help is welcome.
As the Sirius Cybernetics Corporation commercials say:
SHARE AND ENJOY!

The complete commercial version is also available for $20 or 100 french francs or the equivalent in your currency (but of course we prefer dollars or francs) from:
Fabien Royer
3211 Society Drive
CLAYMONT, DE 19703
USA
or:
Bertrand Le Roy
72 rue des Landes
78400 CHATOU
FRANCE

If you want to use F.R.E.E. with PC X-former, please say so because for the moment you can only use the first disk: you can't swap disks 'on the fly' and F.R.E.E. for the moment uses only the first drive.
But I am working on a special version that accepts to use any present drive, and this will enable you to use F.R.E.E. with PC X-former 2.5.
For this I need one or two weeks (I have other activities, sorry). Thanks for your patience.
Of course, the 'normal' version is AVAILABLE.

Should I put the binary uuencoded disk images of the DEMO in this newsgroup?

Bye. I hope that you will enjoy F.R.E.E.

3276. Flickerterm and Ice-T (was Re: Thanks for Flickerterm)

> I always used Kermit65 in 80 column mode. are any of the new programs
>better than this?

YES!!

I just tried both Ice-T and Flick this week, and was impressed with both. Since I was having trouble using the 486 to put them on a disk that the Atari could read, I re-downloaded them from the archive with my 2400bps modem. However, it took much longer than it should have to do that: Bobterm doesn't work all that well with Unix, especially with a 40-column screen; Kermit showed more character lossage than I've ever seen before (must be an example of software rot). I switched between them a few times, eventually getting the files d/l-ed to my ramdisk.

Then I tried each new program out, and I was amazed. Flick is annoying to look at, especially with inverse-video characters, but it is fast. Ice-T looks a lot like Kermit, but better -- I like the smooth and easy transition between term mode and command mode, and the drop-down menus are nice. Flick's user interface reminds me of Procomm for MS-DOS. This is a bad thing.

I'm surprised nobody's mentioned the keyboard handling of the two programs. Flick uses the keyboard much like Kermit, such as arrow keys being shift-control- up, down, <, >. Ice-T is vastly superior here, using (gasp!) the real Atari arrow-key combinations. After using Ice-T for a while, then switching to Flick, I got momentarily confused whenever I tried to type a tilde -- Ice-T uses the Atari key for that, while Flick (like Kermit) uses it for flow control. You can imagine the results.

As I said before (and as mentioned in its docs), Flick's inverse-video is horrible. However, it does do bold quite nicely -- as far as I know, a feature unique among Atari term programs.

One bug in Ice-T bothered me: after running Lynx on the machine I was connected to, scrolling broke. At the bottom line, everything just kept reprinting on the bottom line; at the top, I got 2 lines before everything kept reprinting on the same line. My solution was to exit to DOS, load ICET.BAK, then signal the remote machine to redraw the screen.

Overall, at 2400 I definitely give the edge to Ice-T. Flick is a close second, and the old Kermit and Bobterm are far behind.

As far as I'm concerned, the only reason to stay with Kermit is for
kermit file transfers. (Hint hint, Itay :-)

Rally-X was hot! Those little smoke screens we're cool.. Why the heck was this machine overlooked by developers? Hmm, should be able to pick up a full size for 100 bux? I'll try looking for one.. If anyone is in the detroit area, wanna tag along with me on a machine auction?? I went to an auction last month, prices are UNREAL.

There is a utility floating out there somewhere that will totally erase drives by writing nulls I guess, to it.

I forget the name of it, but I really need it.

Bob Puff's formatting routines don't do a good enough job of getting rid of what's underneath. Formatting Sparta over MYDOS and vice versa can often lead to problems.

My drive is such a mess I'd really like to purge some partitions and start over. I've got this flaky on my main MYDOS partition that when it boots I get popped into a weird directory and I can't run anything unless I first change directory to 1: It's like 2 directories on one drive.

3280. WTB/Trade: Power Supply for 1050, some other questions/comments

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-15 00:00:00 UTC
From: lymang@cybernetics.net
Message-ID: <lymang-1504950656430001@dsnine.cybernetics.net>
Source record: 92521

Hi everyone! Having finally gotten around to sorting through my piles of equipment, it turns out I've got a 1050 floppy drive with no power supply. I read through the newbie 8 bit faq, and the regular faq, and checked every single power supply I have, and it's just not there. Here's what I'd like to know: Does anyone have a power supply for sale out there, cheap, or does anyone want to trade? I have a 600XL, that seems to be working, and two 810's, also a power supply for a 5200. In addition, I need to find a serial interface, I guess, if I want to download files on my Mac from the Internet and transfer them via null modem cable to the Atari. At least, that was my understanding after reading the FAQ. It has been a LONG time since I used an Atari, but I'm glad I have decided to get back into it.

Another question: has anyone else found an 'alternate' power supply for the 1050? I would be more than willing to go out to Radio Shack or whereever and buy an alternate power supply, but I must admit to a bit of confusion after reading the power supply section in the FAQ. Thanks, BTW, for the FAQ, it allowed me to identify all my Atari pwr sps.....

In NZ, we were able to get replacement keys that someone molded out of some kind of "junk" metal, and they worked just fine, and still would too if it weren't for the fact that I have pretty much everything on disk now that I used to have on tape.

>concern.

I understand the logic, but I like Ice-T's logic better.
bleah to vi, but not emacs. :-)
Pico is merely tolerable for me.

I use the arrow keys constantly (even when I use Pico), and only rarely use
^_ and ^^.

>How doe Ice-T generate ^^ and ^_ and the like? Or CAN it?

Ice-T uses control-6 for ^^ (which makes perfect sense -- that's what you
hit on other keyboards) and control-: for ^_ (which doesn't). It looks to
me like ^_ and ~ are the only ones not on a fairly mnemonic key, but I
think the arrows more than make up for that (and I think ~ is better on the
Atari key than on the other possibilities I've seen). Sorry, but I'll take
normal arrow keys over obvious ^_ and ^^.
Ice-T can also easily generate `, {, }, ^@, ^[, ^], and ^? with the obvious
keystrokes. (Well, ` isn't quite as obvious as the others, but it's
control-7.)

Shift-control-up/down
Shift-control- < / >

Since the keyboard doesn't send any codes for
shift-control-left/right, the greater-than/less-than keys were used
instead, just like in Kermit.

3287. F.R.E.E. Demo

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-15 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3mp59f$a0h@nic-nac.CSU.net>
Source record: 92528

I've gotten the demo version of F.R.E.E. to work! (The author accidentally sent me a ST Xformer / PC Xformer .XFD files but named them .ATR's and I had to prepend the 16-byte header to them.)

It's a pretty cool game. I've seen The Pawn for the Atari, and must say that this game has a much nicer, simpler to use interface (although SOME commands are NOT listed and selectable with the joystick/arrow keys! Remember this when you play it!).

Both games, however, had some standard responses. I was amused when, while playing The Pawn, somebody said something like "How the hell should I know?", but then VERY disappointed when it seemed that ALL characters would react like that, unless they knew. With F.R.E.E., things like "It won't move, anyway" get said all the time, but at least they aren't vocal responses from the game's characters! :) (Actually, to tell the truth, I've only seen two characters, one didn't say anything and was more or less an idiot, and the other made me leave right away because I was naked.)

To compare F.R.E.E. (and The Pawn) to ANY of the files I've seen at UMich under the "Adventure" directory would be ridiculous, because those are most often pretty lame (compared to "today's standards") text-based adventures who would say something like "you see a chair and a table" and if you ask it (once you figure out the correct command :)) to "examine the chair", it would end up claiming there WAS no chair! :)

(Oh, I must say I was quite happy with the Pawn when it let me put stuff inside of a wheel-barrow and with F.R.E.E. when I put a bunch of inventory in one room, left, and came back and it was still there. For some reason, I was being pessimistic and thinking it wouldn't let me do something like that.)

As for F.R.E.E.'s graphics, it's usually quite nice, although more cartoony than the Pawn (but of course, the "F" in F.R.E.E. stands for "Funny" :)), because at times pictures in the Pawn look as though they were converted from scanned photographs and then touched up.

Anyway, I suggest ANYone out there, whether you like adventure games a lot or not, to go get the demo version of F.R.E.E. and try it out. (And while you're at it, tell me how to get some CLOTHES!) I'm not POSITIVE I'd spend $20 for it, but $20 isn't very much any more. :)

Thanx to Bertrand Le Roy and the other two authors/etc. for such a cool looking game!

3288. NEW ATARI 8-BIT SUPPORTING HOME PAGE!

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-15 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3mp96a$cio@nic-nac.CSU.net>
Source record: 92529

Ok, it's been FAR too long and my Atari stuff isn't getting much bigger
as of late, so it's time to finally publically announce my home page!

Bill Kendrick's Home page: http://zippy.sonoma.edu/~kendrick

From within, I have the following "areas" which would be of interest to
Atarians:

New Breed Software's Home Page
With a catalog of Atari and IBM software
A list of upcoming titles from New Breed Software (currently all 8-bit!)
The latest version (currently still ASCII text) of my emulator FAQ
A blurb on Branch Always Software's Atari 8-bit and ST Emulators
Information about ADOS (none yet, but some of the conceptual docs I've
written are there)
Other Home Pages
Including Atari 8-bit home pages
Other Atari home pages (Lynx, Jaguar, ST, stores)
Other home pages..
Other stuff..

If you have access to a Mac, MS Windows or X-Windows machine which is hooked
up to the Internet (either via some direct like or via PPP and a high speed
modem) and you have or can get NetScape, MacWeb, Mosaic or some other graphical
Web browser, you'll get to see the nifty graphics! (Currently no screen
shots, but a lot of iconics, especially for games and demos). I currently have
no sound files up either.

If you have access to a Unix or VAX machine, try running the program "lynx"
from your shell and you'll get a text-based representation.

Have fun! And if you drop by, please leave me a note as I haven't added
one of those cool counters yet. :)

From: F Tooned <ftooned@delphi.com>
Message-ID: <5A+8oH+.ftooned@delphi.com>
Source record: 92531

Hi All,

My lease has expired, and I'm going to be shuffling things around
here at FTe for the next few weeks. (I had completely forgot about the
lease running out...) The phones will be off, until things get resituated.

I'll be sending out the catalogs once the "new" info is available.

Not to worry! I'll be checking in here at least once a week, to
keep tabs on the situation.

Man, I've gotten hammered here with E-Mail over the past two
weeks! Thanks for taken the time to request product info... I was beginning
to think that there was only a few people still out there. I mean, I've
gotten more mail in the past two weeks than I have in the past 4-5 months.

I may not be able to make an appearance at the Sacramento Show,
due to the very recent changes...

Once again, Thanks for the support! It's gonna be a really cool
summer for the Atari 8-Bits!!

Mike

3291. Hard disk recovery files

Newsgroup: comp.sys.atari.8bit

From: cooley@nevada.edu
Message-ID: <3mpc8s$dj@news.nevada.edu>
Source record: 92532

hello there. I'm looking for recovery files for hard disks. I'm using an MIO board, and the drive sounded bad soon before the whole directory got messed up. I have used a file, i think its called HDRECVR.COM, but I don't know what I did with it. Could someone point me in the right direction, like an ftp site, where i can get this or any files to recover my directory?

i'd appreciate it a lot!

thanks!

: Legal or not, I stand in support of liberation for all atari 8 bit
: warez. If nothing else, I implore anyone out there who is reading
: this to maintain your library of warez in a fashion that will
: be as permanent and long lasting as possible.

It is far too early to put up the banner of piracy for the sake of
preservation.

Wait until the nails are in the coffin.

Obviously many individuals already have SuperArchivers and are
keeping their protected disks from going bad from age.

Don't try to rationalize warez boards.

You will find yourself with more enemies than friends and possibly get in
trouble with the law as a result.

A friend of a friend of mine ran an IBM pirate board and got in serious
trouble because of it. Just because there is a proliferation of
lawbreakers doesn't mean you are going to get away with it.

All it takes is one taddletale to put your ass in a sling, and if you
think companies like Atari Corp. or Sierra Online or Activision don't
care about you because it's just 8-bit software, think again.

The mortal Rob Funk wrote:

: I'm surprised nobody's mentioned the keyboard handling of the two
: programs. Flick uses the keyboard much like Kermit, such as arrow
: keys being shift-control- up, down, <, >. Ice-T is vastly superior
: here, using (gasp!) the real Atari arrow-key combinations. After
: using Ice-T for a while, then switching to Flick, I got momentarily
: confused whenever I tried to type a tilde -- Ice-T uses the Atari key
: for that, while Flick (like Kermit) uses it for flow control. You can
: imagine the results.

The keys in and around the arrows have ASCII values. Control ^ for instance, is a key used in the PICO editor to mark text blocks. So instead of moving these special characters elsewhere which would have been harder to remember, he allowed the control keys to be WYSIWYG and use shift control for the arrows. Due to the keyboard system, shift control left and right arrows can not be read, so < and > had to be substituted.

So you have to understand that there was some logic behind this. I use ^^ constantly in my internet sessions. I don't know about others. If you use vi or emacs (bleah) as your editors maybe this isn't as much of a concern.

How doe Ice-T generate ^^ and ^_ and the like? Or CAN it?

Hey Bill.. all Ataris can have up to >8< physical drives or MORE!

Most DRIVES themselves allow being numbered from only 1-4, not 1-8, but some do and I think there's a fix for at least the 1050 to allow it's numbering to go up to 8.

(BTW, this is what I've heard, I could be wrong (re: most drives..etc.))

Also, the 1200XL can get a PBI port added to it with a bit of work.

ALSO, some hard drives can be controlled with joystick ports/SIO (I KNOW jstick, I'm guessing on SIO).

Also, there's a Woolley hack to add an IDE hard drive INTERNALLY into a 1200XL.

Finally, SIO2PC is GREAT as an in-between, but I'm not planning on keeping it forever! :) Too slow! Too small .. I only have a 20MB HD on my PC, and a lot of that is taken up already! I may stick to boot-disk-based games which I rarely play on the SIO2PC, but for development and the types of things I WANT to do, a standard-speed SIO2PC (ie, not hyper-speed) drive and a small, 256K RAMdisk are too little! :(

I need MORE memory! I need an MIO2 or MIO or BlackBox! :)

3295. Re: Ace of American BBS

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-15 00:00:00 UTC
From: krishna@primenet.com
Message-ID: <3mng17$t5b@news.primenet.com>
Source record: 92536

The mortal James King wrote:
: Can somebody out there please send me the current BBS # for the Carina Support BBS, Ace of America?

: In addition, is anybody out there selling their Carina 2.5 BBS package? GLENN S.???

I've noticed, Jim, that sometimes you get all interested in this or that, for one reason or another, but Carina is a piece of software you should avoid using.

It is buggy, slow, and is by far the most stagnant of the BBS programs in current use today. Which is a real shame because it has a lovely command line interface which deserves to be ripped from it and put to use in a sleek new Basic XE environment.

Forem XEP is the one to try if you are into BBS programs written in an interpreted language such as BASIC. Forem XEP's nice wide programming environment make it even easier and more fun than writing tiny swap files in PRO! (which to me only reminds me of ancient drum memory in MINIcomputers rather than machines which routinely have 256K or more banked RAM in it which is used at best only for ramdisks). Such is the legacy of writing for the LCD of 64K machines.

The current plight of Carina is the direct result of bad decisions, bad programming, and illogical biases courtesy of David Hunt (who has a fitting alias of The Shadow). He started out with a distrust for 9600 and 14.4 modems which probably persists to this day. Such that he has a psychotic lack of understanding of the necessity to support high speed modems. Add that to the fact that he has a MIO and a distrust of the Black Box so even if he were running PRO! He'd probably experience problems running 14.4s with compression enabled and you pretty much have a doom-scenario here as far as the odds of Carina ever supporting more than 2400 baud reliably.

He's made a couple forays into highspeed. He came on and posted that suddenly his board now supported high speed modems but I tried logging on and got the same old 2400 baud throughput so his head is up his ass as far as his claims.

He's good with that, making claims. That's about all he is is a bullshit artist. The only thing he ever followed through on in my days with Carina was the fairly simple PC Pursuit networking software (and for those who perk up hearing this, let me repeat that PC Pursuit no longer exists as a service, something like it has popped up but I forget the name of it.).

He made a verbal agreement with Tom Hunt to have him rewrite MOE, the machine language core of Carina. This came to nothing when Shadow failed to send Tom the sourcecode to MOE 2.5. Shadow eventually found the sourcecode but kept it to himself, citing at the time that he really wanted to do all the work himself. This coming from someone who admits he is a little shaky on his machine language and doesn't believe in hexadecimal numbers. I question the sanity of anyone who turns down the help from someone as good as Tom Hunt, especially since Tom was quite revved up about the project and would have been a fast worker.

Last time I got a status report on Carina, Shadow had publically admitted that he was putting the 8-bit on the backburner as he tries to make money with his dayjob. So where he wasn't doing much with the software before, now he's doing even less so the much vaunted rewrite of Carina 3.0 is probably farther away than ever. I haven't connected to his board in a few months but I assume nothing has changed.

He is amazingly anachronistic (which I guess is not uncommon with 8-bitters) but coupled with that he is eccentric to the point of lunacy; yet his immediate erea around Portland is so uniquely rich with 8-bitters who worship him like a cultleader that he is cushioned partly from the realization that the sky is falling outside of "Mt. Carmel". And so he does not see that he has a responsibility to try to keep his software moving forward to keep 8-bitters interested, not just maintaining the ailing status-quo which is only effective within his inner-circle.

I can not count the amount of claims Mr. Hunt has made about the Atari8 which he could not back up with evidence, claims which he obviously thought would take somebody wavering in their loyalty to the machine and keep them interested like a hook, waiting for the proof to arrive. It's all an act that David does to keep people from jumping ship, and he plays his part like a veritable Olivier. He's the Bob Lazar of the 8-bit world (for those of you who are familiar with UFOlogy). And things like mythical hardware 80 collumns support in ANTIC/GTIA,128K screenmemory 256 color graphics modes, banked ram handlers and ramcarts that let you use memory like 24-bit linear RAM, and IBM PC DOS V emulation are his Element 115 and "Sport Model". Stuff that sounds great, is surrounded by technobabbly, but can not be proven. I am rambling on about this so much only because I was caught within his spell for so long and it was embarrassing when I finally came to my senses.

For those who don't know this, my handle, KRISHNA, came as a result of namecalling that was going on while I was spouting off about Hunt's claims in the PRO! world (which is split off from the Carina world for the most part) in which people slammed me hard for believing what anyone would say.

So although Jim probably knows most of this story, I'm relating it mostly for the benefit of those who do not, and to warn them not to become another pawn in Shadow's cruel mindgame. Don't be another Krishna. I don't change my handle because it sounds good, but it is also a reminder of my foolishness like a badge of dishonor that I wear. It isn't often that I relate the entire tale surrounding my handle, and I have reams of

long distance bills from debugging sessions and just bullshit talk sessions with Shadow to show how damaging my association with him was in monetary terms.

Those in the Portland era to whom all this comes as a surprise, it would be worth your while to call him up and ask to visit him because I've spoken with people in the same room with him who validate his claims, so the only way to take him to task on this is to visit him and ask for the visual proof, such has his mythical 600XLD, his 1450XLD drives, his 1090XL software PC emulator setup, his 16MB EEPROM Magna RAMCARTs, his 1040XE (that is a whole story unto itself--Atari's "Hangar 18" warehouse full of 1 meg XEs with 3.5" drives and LCD XE Laptops with builtin hard drives with a new Spartalike DOS 2.5CP installed) and so on. The memories come back to me like a tidalwave and part of me actually starts to get interested again as if there was a sliver of truth to any of this because I _wish_ it were true... :(

Right, the problem is you get the same picture quality you would get on
a composite monitor. You end up spending a lot of money on a new RGB
monitor and a converter and you have similar picture quality. The only
solution is to try and decode what GTIA produces. I've tried. Ain't easy.

> Does any one know how to build one?
>
The only Hard Disk interface that will work on the 1200XL is
the old Supra one that used to SIO port. The 1200XL does NOT
have a PBI interface for an MIO/Blackbox/MIO II to connect
to. The rights to the Surpra interface is now owned by Bob
Klauss (sc) I beleive. He also owns BBS Express PRO and
has a Support BBS somewhere in Utah.
I once re-setup a Supra HD interface and after that,
swore I'd never do it again. All the HD infor, ie: # of heads, cyl
and such, have to be burned into the on board EPROM along
with a lot of other information including your HD Partitions.

> Also how many devices can you hook up to the 1200XL?
> 810 disk drive
> a hard drive
> and a tape drive

1050, XF551, 850, P:R:C, about everything that
can be connected to a 800XL, 130XE.
One thing I would do if I was to continue with a 1200XL:
Find a 600XL and rob the parts needed from it to upgrade the
1200XL to a XE. This requires the OS ROM, the MMU and the
Atari BASIC ROM. There is an article on how to do it somewhere,
the large Atari Archive at Mich edu I'm sure has it, also CServe and
GEine.

The 1200XL needs some serious hacking to make it tolerable, but with a keyboard like that and all that ROOM inside for expansions, it's worth it.

1) the video sux. Needs supervideo upgrade
2) it needs the XL/XE OS mod w/internal basic
3) needs the complex but worthwhile PBI modification
4) last but not least, some banked RAM would be nice.

The great thing about the 1400 series is that aside from no chroma output on the video and no banked RAM, it had it all. A great keyboard w/function keys, PBI (although incompatible currently with the BB/MIO), XL/XE OS and builtin Basic. Then top it off with the speech chip.

That's the main reason it's sad that Atari never got those out the door... By far the biggest blight on the 8-bits is the "pick your poison" of compromises and design faults in the various models. From the 800 with it's now outdated OS, 48K, and underutilized slots, to the 1200XL as per above, to the 800XL and its lack of F1-4 keys, mediocre keyboard feel, and no chroma on the video, to the XE with even worse keyboards, to the XEGS with a detachable but bad keyboard, no PBI and only composite out.

The 1400 series was therefore the closest Atari ever came to a machine which was pretty much ideal --from the factory.

And considering the 1400s rarity, the 1200XL is the next one to go for as far as building the most comfortable system. Bob Woolley isn't an eccentric for being fond of the 1200XL. To those who just see the 1200XL as an abortion (which it kinda was when it came out) this may come as a shock to hear anyone advocate their usage, but in this day and age of hacking, it is by far the best machine to have as your main unit as long as you do the necessary modifications... It's absolutely painful for me to use the XE keyboard, even the spring type, and the 800XL is only

marginally better.

>is a BAD thing.

Simple - I don't like having to memorize a new set of keystroke
commands for every new program, and the help menu obscures the
terminal screen. Once I know them, I like having the quick keys
available, but I just don't like the general feel of Procomm-style
programs.
I think the main reason Procomm is so popular is that it's so easy to
obtain, and it's been around forever.
Copying it is a bad thing when it could have been (and has been) done
better. There are better ideas to copy these days.

>FlickerTerm was (and is being) written with power users in mind... users who
>don't want to wade through menu after menu to get at a command. With Flick,
>every command is no more than two keystrokes away.

I applaud that. And I do think it's a good and useful program. I
just like Ice-T's user interface better. There I don't have to worry
so much about *which* two keystrokes. It's based on more recent ideas
about user interfaces. And there's no wading.

Of course, you might find it amusing to note that I usually use
Procomm Plus for Windows, and on the Linux system I just installed I
use a clone of Telix, which in turn is also based on Procomm for DOS.

Well, I kinda have a demo :). Written in Action!.

Intro: "New Breed Software Presents" in ATASCII graphics in a text window
at the bottom and fireworks going off one by one above.

Title: Levelor-blind style waterfall fade-in of the title, "C-DEMO"
("Competition Demo" :)) written in ATASCII graphics and then a 2-depth
scrolling star display (2 PMGs + DLI trick) starts up.

Ball: Bouncing 2-PMG ball. All that's nice about it is how it ends
(press a key and the thing falls off of the screen.. heheh :))

That's it.. I was gonna do Plasma, but found it too difficult to figure
out and I would've needed to plan for it better.

I think it's a bit more than 100 lines, I guess I should've checked before
I power-downed my XL, but oh well...

If anyone wants me to UL it here/Umich let me know, but I think I'd rather
add some more stuff.. maybe even a simple music engine via VBI? :)

The stock 810 was never liked much. Had reliability troubles early,
and Atari made a few refits. Single density (90K) only.

The 1050 is smaller and offers dual-density (130K). I'd get one instead
of an 810.

Atari made another drive, the XF551. It also has double-density and
double-sided support (360K).

3310. Re: AMP

Hi Guys!

I'm the Lead Programmer for Star Wars 32X, so I belive I'm qualified to answer this question :)

Way back in 1988, after programming "Labyrinths" for Analog Computing, I began working the Antic Music Processor 1.0 for Antic Magazine. It was published in the December 1988 issue. Having used AMS for years, I felt that the Antic Music Processor was the next level in step entry music sequencing for the Atari 8-bit computers. I loved Philip Price's Advanced Music System, and had spoken with Gary Gilbertson on a number of occasions. I liked the acronym AMP which I adapted to a title that would make Antic Magazine happy. I also liked Phil's rhythm bar motiff so I wrote my own version of it.

In 1989, AMP 2.0 was released. It added lyric support (which was present in 1.0, but not supported) and a number of bug fixes. At this time, Phil was threatening to sue Antic Magazine, believing that they stole AMP from him. But once Phil learned that the only thing the two programs had in common was the playback display, he calmed down. Phil's program was never meant to be used by anyone other than Gary. Gary had told me that a Phil's AMP data file was nothing more than a collection of macros assembled with Atari's macro assembler --- which led to a very long music development cycle. If anything, the Antic Music Processor was a rip of Lee Actor's AMS, from which it shares it's music entry langauge.

After AMP 2.0 was completed, I began work on AMP 3.0 which was an assembly langauge 128 track MIDI sequencer for the Atari ST/TT/Falcon. AMP 3.0 also had a karaoke display... and the ablility to display the music on a piano keyboard in real-time (like Lee Actor's AMS did) in addition to the rhythm bar display. AMP 3.0 also added all the functions and commands that Lee Actor's MMS added to AMS.

In summer of 1992, I left Disneyland for Sega (a division of Sega in Diamond Bar Calif, called Sega Interactive) where I programmed "Dinosaurs for Hire" and "Eternal Champions." I started on AMP 4.0 after "Eternal Champions" shipped in winter of 1993. AMP 4.0 was a three-CPU music driver for the Sega CD. It supported the CD's 6-voice FM, 3-channel PCM, and 6-voice PCM. I ported over the piano display from the ST by using a program on the PC called Animator Pro (which read in .NEO files) and converted it to the Genesis character-based file format. The Sega hardware cannot easily display the rhythm bars - something an 1.8Mhz 1979 piece of 8-bit hardware could easily do - so I had to use the piano display. AMP 4.0 driver was pretty much a line-by-line port from the Atari ST AMP 3.0!

I changed the title to "Advanced Music Processor" in version 4.0, because what would Sega say if it was called the "Antic Music Processor"? I wanted to stay with the AMP acronym, and really didn't like "A Music Program", so I borrowed Phil's title - my homage to one of the best 8-bit Atari programmers ever. If you have any doubts, check out A.R. or Tail of Beta Lyrae (sp?). Phil was one of the first programmers I knew of who releazed that music should be an integral part of a game.

AMP 5.0 followed for the Sega Genesis. Version 5.0M ("M" is for MARS, the original name for the 32X) was the Star Wars music driver. The current version of AMP is 5.2M and is being used by our division in our next line of 32X products.

I was hoping that some 8-bit Atari people would make the connection. The people on the Sega message bases think that it's a suped-up SID player (ACK!!!!). So if you guys still want to send pictures do Die-Hard Game fan, please send them copies of my Antic Music Processor, not Phil's program.

Apart from Sega, I'm currently working on AMP 6.0 (which is really called WinAMP 1.0) a 128 track MIDI sequencer for Microsoft Windows.

I don't know what the market value of the ATR-8000 (64k) interface with 2
Tandy DS/DD floppies is but I'll give this a try anyway.

FOR SALE OR TRADE:

FOR SALE:

ATR-8000 64k Model
P:rinter Port
R:S-232 Port
D:isk Drive Port for up to 8 dirves (720K each)

ATR-8000 is also a CP/M computer but I haven't seen it work in that mode.
I have the CP/M software, I think.

Includes Two (2) DS/DD 5.25 Floppy Drives.

$200 o.b.o./Make offer Includes shipping. <no flames please>

I also have a non-working ATR-8000 should be repairable $40 includes
shipping.

OR TRADE for 130XE.

Thanks,
Chris

I'll offer a new package of SynTrend to the winner of this demo
contest!

OR the winner can get a boxed set of Alternate REality: the Dungeon.

How's that for a prize?

Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit

The closest I've seen was Getaway. It had the giant, multi-directional maze, you picked up things (money instead of flags), and were chased by other cars. No smoke screens though, and the game had a bit more depth than Rally-X. (It wasn't really a clone, but it had lots of similarities).

I was just thinking...

How about a mini-competition? Well, sort of a competition - no prizes
or anything (unless someone wants to donate something???)

Anyway, how about best graphic/sound demo in say 20 lines, or 100 lines or
something?

If we make it short, then you could just post submissions here in c.s.a.8
and we could all either cut & paste, or type them in.

Sound a good idea? I just wanted to suggest something constructive here,
rather than all this nagging that's been going on.

Sorry I don't have anything to start the ball rolling with (I just thought
of this thing) - but does this sound a good idea?

Should it be limited to either Basic or Assembler (in Basic data lines)?
I don't have Action! and I guess others don't too, but most seem to have
Atari basic *grin*

Message-ID: <FDQNEAUSUp@stingray.manawatu.gen.nz>
Source record: 92545

Hmm.

I was also thinking that maybe we could have some tips and info or something in this group.

I mean, I have several little routines that do things like rainbow colours down the screen - things lots of people have, but not everyone - and if there are people like me (several years ago), who would like to learn this stuff, well I think it would be cool to do something like this.

Ofcourse, I'm not volunteering or anything, but if somone finds something tucked away in the cupboard that is fairly short, and might be of use to someone else in the 8bit world, how about sharing it here on c.s.a.8?

I _can_ start the ball rolling on this one - just as soon as I find my old printouts (from a 1020) and type them in.

>>cp576@cleveland.freenet.edu
>>
>A question: how do you find all this time? The RVerter clone, the game
>Mr Fish, and now this?

I first started the Eprom Programmer quite a few years ago. I
just simplified it a little and modified the software. I just
programed Mr. Fish over a couple weeks in my spare time. It was
going to be an adventure game but seemed to lame.

Another project I have and sometimes still working on is:

A C compiler semi-compatable with CC65 but directly supports float
and long data types. Would anyone be interested? It is in ML and
not C so it would be difficult to make into a cross compiler.
It won't be ANSI C or much faster than CC65 programs but should
be more compatable. I have a lot written but a lot to go. Look for
it in 1998. Maybe Not. Since I wrote KASM and KLINK I have been
building libraries of common routines to reduce the amount of code
to be written from I/O to generic hash-table routines.

Things I wrote and never finished completely:

3320. Problem with 512k upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-16 00:00:00 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3mq36v$r8h@usenet.INS.CWRU.Edu>
Source record: 92547

I need help with my 512K upgrade. As long as I don't access
the extra banks it works fine. If I set up a 512K ramdisk
sometimes I get glitches screen or with the RAMDISK.
Screen glitches may occur even when the screen is not in the
banking window. It seems to vary depending on how long the
computer is on so it is probably some timing problem. For
some reason it does not switch properly. I have used both
a 74S153 and a 74F153. In the 256K upgrade (RAMBO compat) I
have a "S" chips instead of "LS" chips which should be faster
- could this cause a problem. The 74S139 on the 256K outputs
a signal used by the 512K upgrade. It is low when PB4 is low
and the address range is 16384-32767 I believe. I don't see
how a faster chip in the position could cause a problem.
I kept all the CAS line as isolated as possible so they should
not intefere with each other. The diagnostic Banking seems to be
OK.

The connextions to the 74S139 for the 512K add I have are
(anything wrong???)

74S153

```
___________
CAS'-------+1 e' +V16+------- +V
Gnd----+2 A e'15+------- PIA (PB7)
(12)+3 B A 14+--- Gnd
CAS1'-^^^--+4 00 B 13+----From 256K ckt (74LS153,pin 14)
|5 01 00 12|(3)
CAS2'-^^^--+6 10 01 11+------Pin 6 MMU (low for diagnostic)
|7 11 10 10|
Gnd ---+8 Gnd 11 9| Two resistors are 33 ohm
\__________/
```

Note: Pins 3 and 12 are connected. 2,14 and 8 are grounded.
(The circuit description I had the line from the 256K upgrade
going to pin 2 which is obviously wrong).
CAS' is the output from the right side of R108. CAS1' goes to the
left side of R108 via a resistor (which goes to pin 15 of all RAMS).
CAS2' goes to pin 15 of the top row of stacked RAMS via a resistor.
All RAMs are 150NS. If any connections differ from above in
anyone else diagram let me know.

Could the problem be with MYDOS? It does properly give the RAMDISK
size. I am using version 4.50.

Ken Siders :-(

Atari 8-bit wishlist

Looking for the following games, cartridge or disk, with original
docs, for the 800/XL/XE. Titles with a "?" I need info about what
they are. Thanks!

800/XL/XE - must include docs!
--------------------------------------
Archon II
BC Quest for Tires
Beamrider
Blue Max - only need docs!
Burgertime
Choplifter
Creepy Corridors ?
Crossbow
Crossfire
Dark Crystal
Dragonriders of Pern
Encounter ?
Frogger II
Gyruss
Halley Project
Kangaroo
Karateka
Legionnaire ?
Mario Bros.
Marble Madness
Montezuma's Revenge
Moonsweeper
Moon Patrol
Mousetrap (arcade version?)
Mr. Do!
Nautilus ?
Phantasie I-II
Pharoah's Curse ?
Pharoah's Revenge ?
Phoenix - arcade
Pitfall II
Pole Position II - does this exist?
Q*Bert's Qubes!
Serpentine
Space Shuttle
Starcross
Star Raiders II - cartridge version
```

Super Cobra
Thunderfox ?
Time Pilot
Tower Toppler
Trailblazer
Tutankham (PB cart)
Venture - arcade (Atari?)
Wizard's Crown
Zenji ?

Also any Tolkien based graphic Adv/RP games.
Good Astronomy/Planetarium program for Atari 8-bit that is
updatable & takes full advantage of the Atari's abilities.

Atari 2600 - must include original docs!
- no late release (1985-90) classic 1978-84 carts!
- picture labels much preferred.

Advanced D & D
Basic Programming - with inst/overlays
China Syndrome ?
Circus Atari
Crazy Climber (someday...)
Crossbow
Dark Chambers
Dodge 'em
Dolphin ?
Dragonfire - imagic picture label/good cond.
Encounter at L-5
Exocet ?
Frogger
Frogger II
Gravitar - silver label
Home Run
Indy 500
Kick Man ?
Maze Craze
Miniature Golf
Montezuma's Revenge
Moonsweeper - imagic picture label
Mr. Do!
Mystic Castle ?
Pengo
Pitfall!
Pole Position
Raiders of the Lost Ark
Secret Quest
Sentinel
Skiing
Smurf: Rescue
Solar Fox ?

Sorcerer's Apprentice
Space Shuttle
Starmaster ?
Star Voyager ?
SwordQuest: Waterworld
Tunnel Runner
Video Chess
Video Olympics
Video Pinball
Zoo Fun ?

Only need original docs for these 2600 carts:

Atlantis
Berserk
Cosmic Ark
Defender
E.T.
Galaxian
Jr. Pac-Man
Krull
Night Driver
Pac-Man
Solaris

Atari 7800 - must include docs!

Food Fight
Planet Smashers ?

Atari computer & 2600 catalogs wanted!

Chances are the DOS 2.5 disk is in ED (Extended Density), as supported by the
1050 (and later) drives. The 810 is SD (Single Density) only, as far as I
know. The games would be in SD format so people with 810's wouldn't get pissed
off when they wouldn't work. :)

3326. Are there "arrow keys" in Flickerterm?

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-16 00:00:00 UTC
From: ehalliwe@emh.kunsan.af.mil
Message-ID: <9504170722.AA20804@emh.kunsan.af.mil>
Source record: 92553

Are there arrow keys in FlickerTerm? In the currently available version, no. However, the version I and a few others are using supports what I call "arrow key mode".

Believe me, I don't like having to do CTRL-SHIFT or SELECT key combinations just to move the cursor around. But as Glenn S. pointed out, there are very good reasons for NOT putting the arrow keys on CTRL *+-=. So what I did was this: If you hit CTRL-SHIFT-RETURN (or CTRL-RETURN or SHIFT-RETURN), Flick goes into Arrow Key mode. In this mode, hitting *+-= BY THEMSELVES will send out the appropriate arrow key codes. I love this mode, and use it all the time. Oh yeah, you have to hold down CTRL to send the actual *+-= characters. Not a bad tradeoff.

Another thing people have mentioned lately is the legibility of FlickerTerm. Yes, it takes getting used to (kind of like with ColorView images). European users will most likely have a harder time tolerating it, due to the slower frame rate (although it does check PALNTSC so the online timer will still run correctly).

Several folks have posted saying you should set the text as dim as possible. In my experience, this dimness just creates more eyestrain. My general rule is this: Set the screen as dark as possible (I favor a dark blue), the text fairly bright, and most importantly, avoid having any light sources shining directly on the screen.

One major advantage of the FlickerTerm display, which I haven't seen mentioned, is that the text is clearly legible on a regular TV or composite monitor. The problem with most 80-column displays is that they use characters only 3 bits wide, so characters like QWUOADGHXB end up as a green or purple smear with a couple of black lines going throught it, and you basically have to learn which smear pattern represents what letter.

Flick doesn't have this problem. Since all 4 bits are used, vertical lines are always separated by 2 pixels, so artifacting smear is eliminated.

In another earlier message, someone negatively compared Flick's general setup to that of Procomm on the PCs. Well, that someone was correct-- I did intentionally pattern the menu scheme and status line after Procomm. However, I fail to see how copying one of the single most popular PC term programs ever is a BAD thing.

FlickerTerm was (and is being) written with power users in mind... users who don't want to wade through menu after menu to get at a command. With Flick, every command is no more than two keystrokes away.

Finally, I'd like to thank everyone who has spoken kindly of FlickerTerm and use it regularly. I am still working on it. No protocols yet, but I'm getting

ready to add something you all should find VERY interesting.

3328. FTP site closing for good 5/5/95

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-17 00:00:00 UTC
From: heller@akh104.rh.psu.edu
Message-ID: <3mslq1$q10@hearst.cac.psu.edu>
Source record: 92419
Cross-posted to: rec.games.video.marketplace,rec.games.video.atari,rec.games.video.classic,comp.sys.atari.8bit

On May 5, 1995 akh104.rh.psu.edu will no longer be available to serve
the general Atari public. After 2 years of ftp service for the
Atari Jaguar and the Classic Atari Video Game Systems I have to call
it quits because I am finally graduating after 5 long years.

This is your last change to get hold of MEGS of Jag stuff and
Classic Atari Video game information.

The newest release of the 2600 Label variation list is up under
/pub/Oldatari/Cartlists/2600.labels.v4.gz.

Again, this is your last chance to obtain this info before it
leaves never to return... unless I can pull off getting a T1 line
to my house....

The game is by Mark Reid and is a former APX Classic. The premise is to
elude the law as you travel through a town covering 35 screens and look
for treasures and cash. One of the beauties of this game is that it's
immediately playable by anyone, and yet it's loaded with little twists
and tricks you must master as you progress to higher levels.

: Never saw this. Was it a commercial release? Where can I
get it?

I believe B&C (are they still around?) carries a lot of the old APX
titles. Available from C. Kormos too.

John Collins (aka Bosco)

I would consider a multimedia kit for my 486 as trade for the HD system.

I dont yet have CDROM or soundblaster on my 486..

Those can be purchased locally for $199 and less (and that price
includes excellent speakers)

Don't know if this makes me a power user or not but currently I run CTH's SnapShot with Bobterm, Atar-Z-Modem, FlickerTerm.38 and IceT20. For 14.4 baud, Flicker can't be beat...the 4bit font looks great on my Magnavox80. IceT20 works great for me in IRC's (it's the scroll back buffer).

From: kendrick@zippy.sonoma.edu
Message-ID: <3msmi6$m65@nic-nac.CSU.net>
Source record: 92434

I have AR:Dungeon.. what does SynTrend do? Hmm.. what other game/app. do I
want bad which I don't have? :) Oh well...

So, umm... ok, is there an actual read.me file? I haven't seen it.

If there is, unless any of these aren't answered, just ignore the following:

How big (source/executable) is too big/too small for the demo
How many parts (one screen, multiple screens, multiple files) is allowed?
What types of effects would gain you big points
Who's judging?
What languages are allowed?

That's it I guess..

It was an APX game. It was the first APX game to be specifically
advertised in magazines, it was so good. You can probably get it from
B&C Computervisions (see vendor list).

send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at URL:mailto:mcurrent@carleton.edu

Conventions
-----------
All commercial vendors, developers, and publishers should be listed here.
"Major" shareware/freeware/PD developers should also be listed.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, public domain
software/freeware/shareware, commercial software, used (commercial)
software.
```

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information is given, including prices.

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of the more prominent sources I use. Current Notes magazine, and their 8-Bit Editor Rick Reaser. Atari Classics magazine, published by Jim Hood and Bob Woolley. And The Atari 8-Bit Omnibus, published by David A. Paterson.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

That was an intriguing story, but it's too bad you are stuck at Sega.
Within a year the 32X will be a dead issue which I'm sure you know.

And as for AMP, that's fine for chipmusic, but as far as SEQUENCING,
Miditrack has AMP beat because it is an actual MIDI sequencer.

I realize there is some crossover. The only way to easily create MIDI
music without recording a live performance with the sequencer, is to use
something like MMS (which acts as a step-editor) which uses AMS music
notation and then feeds it through MIDI. MMS was cool because it had 96
voices!

I wish I had MMS now because I am a SHIT keyboard player.

It is common sense to know that the good programmers of the 8-bit world
would not just fall of the face of the earth after the platform does.

r >available, but I just don't like the general feel of Procomm-style

I don't want to pic (well maybe just a little :>) but I've yet to see
any two programs (sometimes even the same programs update) that have
the same command structure (not counting Mac,Windows,GEM,NeXT etc. pull
downs...and even those differ from program to program). TextPRO is different
from AtariWriter...BobTerm is different from Express!...QmodemPRO is different
from Qmodem3.4...

I understand your reason, though for me it's not been a problem as for most
programs I can use the VI key setup (i.e. j up k down h left l right) just
FOH I guess.

There are two versions of Snapshot. The first is for two images, both in RAM (130xe or compat. banking required) You'll have to deselect the XE banks from your RAMdisk to make it work, though. The second is for hard-disk users - up to ten possible snapshots just a keystroke away. Unfortunately, some programs kill snapshot. I seem to recall that TEdit disables snapshot.

Fireworks is nothin. All you have to compensate for is the fact that, unless you use the floating-point routines, you have no rational numbers for the sparks to fly at (ie, 1 pixel every 5 frames).

You can either make the slowest sparkels move at 1 pixel per frame, or you can do a reversal of the math and make it 1 move every 5 frames.. In floating that'd be "1/5", but here, I used a count-down from 5 to 0. When it hit 0 it'd move the sparkel and reset the counter back to 5.

Worked pretty nicely. I only have one firework going off at a time though.

Other details..

The blind-style fade-in of the title was done by having a DLI which did a "WSYNC ; FOREGDCOLOR=ARRAY(VAR+VCOUNT)" 8 times

That is, it would allow me to change the color of each text line 8 times (ie, for every SCAN line, not just the text line). The color would depend on 1) A Variable which I was twiddling while the DLI was on and 2) VCOUNT (how far down the screen it is). I forgot about the MOD or & or something in there to keep it within a certain bounds, but that's more or less how I did it. The Array contained 15 blacks, 15 shades of grey and 15 whites (so it would start out black and the greys would fall down and it would all turn white).

A rainbow would be very simple as well.

...

The stars were done with another DLI. No VBI here, just a FOR/DO/OD loop. Two PMG's (one grey, one white) and a DLI which said "for every text line, I want the PMGs' X locations to be: ARRAY(VCOUNT)+VAR VAR would move the stars (without it, it'd just be a random set of static stars). VCOUNT did what it did before (gave each star it's own position down the screen), and ARRAY is, beforehand, filled with random numbers. The PMG itself is just player 1, turned off, with the "fill the PMG with this one byte" mode. (No RAM is wasted! Cool!)

...

The ball's just a pair of bouncing PMG's.. easiest part of it.. that's why I need some ideas for other stuff! :)

>intentionally pattern the menu scheme and status line after Procomm. However,
>I fail to see how copying one of the single most popular PC term programs ever
>is a BAD thing.

Fortunately, I'm a former PCPlus user (until I got FT80, I used
PCPlus daily), so the problems other cite don't hold true for me. :)
And, you are correct: it is the most popular PC term program (and therefore
the most popular term program ever,most likely), so emulating it is NOT
a bad design decision!

>FlickerTerm was (and is being) written with power users in mind... users who
>don't want to wade through menu after menu to get at a command. With Flick,
>every command is no more than two keystrokes away.

Thank you thank you thank you. :)
I know you will continue to get complaints about that, because I
run a BBS which uses software that follows the same principle as regards
number of keystrokes. No multiple menu levels in that program. And that
is the way I like it. But, I do get complaints occasionally. 'm ttoo
ornery to change, tho. :)

I tried on more than one occasion to get ahold of the Transkey folks...
I think it was Dataque and then someone else bought it, or vice-versa. I
sent mail (not email) to both of them, and I can't remember, but I think
I even enclosed a self-addressed, stamped envelope on one occasion.
Seems like they take public-relations lessons from Bob Puff at CSS. I
gave up on the Transkey.... I figured they'd have replied if they were
very interested in selling them.....and if someone isn't very interested
in selling something, I don't even want to know how high the price must
be, 'cause I'm no longer interested!

(Just my 2-cents.... The Transkey *sounds* great, however. Must be nice
for those people who have/can get them!

I just obtained a CITIZEN "GSX-230" 24 pin graphics printer.
However all of my Epson graphics dumps are for the 9 pins.
I have GR.8 & GR.9 dumps and MI dumps etc.. they don't work
with this new 24 pin formatt. Any suggestions as to how to get
them to be compatible or know of any newer PD graphics dumps for
the 24 pin printers? Any help would be appreciated.

Date: 1995-04-18 00:00:00 UTC
From: chris@world-one.com
Message-ID: <D77qtq.6ME@world-one.com>
Source record: 92466

I never got the chance to learn to program in assembler on my Atari way back when and would like to give it a go now. Does anyone have an Assembler for 800 or 130XE and some books on programming forsale?

I had a MAC/65 loaned to me but the cart. doesn't work, the loaner suspects it got fried in an EPROM project. MAC/65 from OSS I believe was the big assembler at the time.

I know of the Action! language but, does that allow as tight of and EXE as assembled code?

Thanks,
Chris

Source record: 92467

I think there is a 6502 crossassembler for the PC. Ask around in comp.
emulators.misc. :)

As for Atari <-> PC xfers, well, let's see..

modem (up to 14.4k bps)
null-modem
SIO2PC (make the PC act like it's from 1 to 4 Atari disk drives, up to
16MB per drive or as little as 64K per drive - plus print through)
Black Box modem/printer/hard-drive interface + FloppyBoard PC floppy int.
some software to read/write Atari DoubleDens. disks on a PC

probably a few other things.. I should know this.. My Unofficial FAQ
goes over a lot of it. :)

If you still have an Atari 8-bit, get an SIO2PC cable cheap, download the
SIO2PC software for your IBM, get a hold of DCM2DKS, get a ton of demos
from Umich and REMINISCE (or, to put it better, become INSPIRED) about
the abilities of the ol' Atari Classic! :)

3379. Hack around with disk drives.

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-18 00:00:00 UTC
From: ai542@FreeNet.Carleton.CA
Message-ID: <D77Hor.JoM@freenet.carleton.ca>
Source record: 92468

I was hurting for space in the basement, so I decided to consolidate the space occupied by my 130 XE setup and the ever-present IBM clone. After a bit of experimentation, I found that I could remove my Atari 1050 and Indus mechanisms and fit them into an old IBM clone case. The power supply for each fit into the case as well.

Anyway, to make a long story short, I have a system that is at first glance a common IBM clone, but with an unusual keyboard. The monitor sits on top of the case.

My setup is with two floppies but you can fit one floppy and a hard drive without any problems. Now if you have an old IBM PS/2 tower case, you can fit your complete array of Atari equipment; two floppies, hard drive, and if you are really careful, your modem.

All in all, you have some pretty modern looking obsolete equipment....

What I'd like to do is to convert my keyboard to use the standard IBM type keyboard, and have everthing else in the case. That would eliminate the power, peripheral cable, monitor connection and joystick sockets. Maybe I'll work on that this summer.

3380. FS: Three (3) R-Time 8 clock cartridges for sale to best offer

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-18 00:00:00 UTC
From: seipelf@aol.com
Message-ID: <3n0fvl$14s@newsbf02.news.aol.com>
Source record: 92469

I used to operate two Atari 8-bit BBS's, Pandora and ACEC. So I own two R-Time 8's. The third was broken but I repaired it by cleaning the contacts with emory paper (I know a little more now that I'm 24). It's time to sell.

I have replaced the battery in two of the three units and set the clock. Batteries are $2.79 each at Radio Shack (3V Lithium cell). The one whose batter was not replaced puts out 2.3V vs 3.3V for a new battery.

I do not have a manual or box but their use is self-evident for SpartaDOS users (except for usage of the "Z:" handler, which is only of interest to programmers).

I would like to get $50 or $60 for all three but will sell to the highest bidder (I'll get back to you by mail at the end of a 1-week bidding period). You can make an offer on just one if you like but I would prefer to ship them all to a single buyer.

I also have a Corvus hard drive, Atari joyport interface, and Integrator OS board on an Atari 8oo and will take bids for this as well.

>
>If I could have my way (and knew anything about hardware desi I'd write a
>6502 assembler for the PC and a downloader to the 8-bit Atari.

After spending a year writing SNES games, I felt the same way. I wrote my own 6502 cross-assembler for the PC (in less than 5K!) and built an SIO2PC cable to connect 'em. To simulate a typical download system, I assemble everything to a raw binary file with Atari boot disk header and install it as a boot disk with SIO2PC. I have a batch file that takes care of everything. Assembly is instanteous, even on a low-end PC, and "downloading" is pretty quick, as booting from SIO2PC is much faster than from a real drive. Plus, because it is a boot file, I don't have to wait for DOS to load.

I got so into using this system that I rewrote my assembler this year with a somewhat fanatical bent. It's now under 3K and even faster than before.

Yeah, it is called TASM, Table-Driven Assembler, there is also one called MASM, but I believe it is more Commodore specific, but can be rigged to work with Atari code. Of course with these assemblers you will have to hardcode the beginning/ending and RUN code. I believe tasm is on oak.oakland.edu in the SimTel/msdos file system.

3387. Demo-competiton

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-18 00:00:00 UTC

Message-ID: <9504191159.AA10364@emh.kunsan.af.mil>
Source record: 92476

I'd just like to say, I think there should be some sort of limitation on file size for a demo programming contest. Otherwise, you'll have impressive little 1K graphics hacks getting overwhelmed by massive 6-disk monsters.

It's a lot easier to write 10 so-so demos than 1 really great demo. But the demo that goes for quantity over quality often ends up seeming more impressive.

3389. Atari 800 (and related items) For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-18 00:00:00 UTC
From: ggomes@oavax.csuchico.edu
Message-ID: <3n15b6$kkm@charnel.ecst.CSUChico.EDU>
Source record: 92478

Greetings!

Over ten years ago I wrote my dissertation on an Atari 800 using
the AtariWriter word processing software. A short while later, the
hardware found its way into my guest room closet, and there it has
remained.

'Tis the season for spring cleaning (once a decade or so!), and
thus I offer for sale the following items:

Hardware:

Atari 800 Computer
Atari 850 Interface
Rana Systems 1000 Disk Drive
Joystick
Power Supplies (6)
Connecting Cables (2)
Serial-to-Parallel Cable

Software:

AtariWriter Cartridges (2, with manuals)
Atari Basic Cartridge

Books:

Poole, Your Atari Computer
Moore, Lower, & Albrecht, Atari Sound and Graphics
Bell, The VisiCalc Book
Albrecht, Finkel, & Brown, Atari Basic
Poole, Borchers, & Cook Some Common Basic Programs
Haskell, Atari Basic
A.N.A.L.O.G. Computing, The ANALOG Compendium (1983)

Magazines:

ANALOG, #12 (July-August, 1983) through #55 (June 1987),
missing numbers 48 and 50;
Atari Connection, Summer 1983 through Summer 1984;
ST Log, #11 (February 1987) and #12 (March 1987);
Atari Explorer, February 1985

Everything is in working order and in very good condition. Please
e-mail me your fair and best offer. Everything goes to the highest
bidder (no sale of individual items, please), with a minimum offer of
$150. Purchaser also pays one-half of UPS shipping charges.

Please respond via e-mail with your offer--the bidding concludes (and
the sale will be finalized) on April 30.

3390. Re: Any 80 column software emulator/terminal program?

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-18 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3n1613$s72@nic-nac.CSU.net>
Source record: 92479

There's an 80-column engine which replaces the standard E:ditor device with a Graphics 8 bit-map driven screen. Very slow.

There are terminal programs which use Graphics 8 bit-map driven screens. (Term80 for example). Ice-T does as well, but it's very fast because it doesn't physically scroll, it display-list scrolls (like BobTerm does with its 40 columns).

There's also FlickerTerm 80 which uses a trick 80 column mode which Clay (and I at one point!) invented. (I never got it to work because I didn't know how to use VBI's in Action! at the time <sigh>.. if only, huh? ;) hehe) It uses Graphics 0 and two fonts, which get flipped back and forth (and other stuff happens to clean it up some) to produce a flickery (hence the name) 80 column mode. It ALSO uses display-list scrolls to speed it up.

Finally, you have terminals which use the XEP-80 80-column "card" from Atari (BobTerm supports it). It's unfortunately slow though. <sigh>

Good luck!

If you've ever seen HyperCard on a Mac, that's what HyperIt! attempts in a
way to clone. If you've ever seen the World Wide Web (browsing it with a
graphical interface like Mosaic or Netscape) then you'll understand easily
as well.

If NOT, well, let's see...

It's a program which runs scripted files. Each file has references (via
commands; that's why it's scripted- almost a language) to text, fonts,
graphics, and buttons.
It displays each screenful of text/graphics/buttons and lets the user
move a pointer around the screen and click on the buttons.
Each button can be linked to a different screen (screens are called "cards"
and the entire set of cards - the document itself - is called a "stack")

Things you can do with it:

Interactive documents. (Show a table of contents and let the user skip
around without viewing the whole file or searching. Let users click
words they don't understand and have a definition appear.)
Games/demos. (Show a picture of a room and have different things happen
when you click the door, the painting, the chair, etc.)
Teaching tools. (Not unlike games. :))

Get it?
Then go get it! "hitb5.arc" and "hitb5.txt" at Umich.

That should be a matter for the judging, unless those running it
really expect to be overwhelmed with the number of entries. It's
simple enough to consider the technical merits of the 20-disk wonder
vs. the 8K binary.

Also, must they be new programs, or just newly-released programs. In other
words, if I wrote something years ago, but never released it, can I enter
it?

I consider myself the worlds biggest Action! fan, but the two things you mentioned are probably it's only real short commings. The code you produce will always be about 30% larger then something written in assembler & will run about 30% slower. There's a bit of a learning curve you have to go through with Action!, but once you get the hang of it you have a tendancy to use it for everything. If you're just learning assembler, you may want to try one of the PD assemblers available. Charles Marslett, author of MyDOS, has one that mimics the Atari Macro Assembler & I've heard people swear by John Harris's assembler. There's both assembly language programmers & Action! programmers here on the net so whichever way you go, you won't be alone

I'm looking to get a 130XE and/or 800XL.

A 1050 Disk Drive Couldn't hurt.

Also insearch of technical manuals for above computers.

Thanks,
Chris

3399. IDE Harddrive interface

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-18 00:00:00 UTC
From: chris@world-one.com
Message-ID: <D798zG.BoD@world-one.com>
Source record: 92488

I saw a thread a while ago about the development of an IDE harddrive interface. Has any progress been made on it?

Chris

3400. Adaptec 4000a or small SCSI HD wanted!

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-18 00:00:00 UTC
From: James King <jeking7@delphi.com>
Message-ID: <Ju1fZgt.jeking7@delphi.com>
Source record: 92489

I have two dead Adaptec 4000a's (minor blown components, but am unable to find replacement parts) - so am looking to acquire 1-2 more of these gems OR suitable Seagate SCSI hard disk drives.

I have a "kinda beat-up and in need of some help but still works ok"
800XL sitting in my attic. It is quite the war soldier, but still boots;
if memory serves (it's been about 8 months since I last looked at it),
the HELP key doesn't work and (I think) one of the SHIFT keys don't work.
But it works - really!

I'll gladly trade it for something I can actually use. Make an offer.

>Which drive is generally better, an 810 or that newer 10-something (1050)?
>
I own both, and while I'm sure others will readily point to the 1050 as superior (due to it's ability to do enhanced density and with a minor upgrade Double density) I have to say that my 810 (San Jose Computer Special Edition, metal case, Happy installed) has been my most reliable piece of 8 bit equipment. It is a tank, it has nenver failed me, more than I can say for my 1050's.....

>have a PBI interface for an MIO/Blackbox/MIO II to connect
>to.

But it IS possible to add a PBI to the 1200, Bob Wooley did the hack. I have a copy for those interested.

>One thing I would do if I was to continue with a 1200XL:
>Find a 600XL and rob the parts needed from it to upgrade the
>1200XL to a XE. This requires the OS ROM, the MMU and the
>Atari BASIC ROM. There is an article on how to do it somewhere,
>the large Atari Archive at Mich edu I'm sure has it, also CServe and
>GEine.
> R.MIer rbmier@winternet.com

Hmmm.. You mean upgrade it to an 800XL. It is probably cheaper to buy the chips sepperatly and leave basic out. Bob did this hack also and I have done it to both of my 1200's, piece of cake (except for unsoldering the 24 pin ROM socket to put in the 28 pin one for the 600XL/800XL os ROM. What a pain.) This is the first steo in the PBI upgrade of Bob's. A 1200XL with a PBI and an 800XL os is a neat little toy!

Misc/snhd30.arc

I don't know if it will work properly with a RAMdisk, though. I've only ever used the original version. Intuitively, I'd guess that about 3 programs would be the limit with a 192k RAMdisk.

Bill -

I haven't programmed on the ST since I finished AMP 3.0 about 2 years ago. I miss programming on the Atari 8-bit alot more than the ST. You'd be surprised how much the Atari 8-bit does better than a Sega Genesis!!! Only after you've programmed a commercial game machine do you realize how far advanced the 8-bit Atari really was (but I'm just wasting my breath telling you that - you've probably already knew it....)

But after you've used a PC to cross-assemble and remote-debug for another platform, you'll never want to go back to using Devpack for the ST or MAC/65 again.

If I could have my way (and knew anything about hardware desi I'd write a 6502 assembler for the PC and a downloader to the 8-bit Atari. There's still a number of programs I was writing before I got my ST that I never finished. But, I'm so damn busy with Sega and writing AMP for Windows, that I'd probably never have the time...

Glenn Saunders (krishna@primenet.com) wrote:
: And as for AMP, that's fine for chipmusic, but as far as SEQUENCING,
: Miditrack has AMP beat because it is an actual MIDI sequencer.

: I realize there is some crossover. The only way to easily create MIDI
: music without recording a live performance with the sequencer, is to use
: something like MMS (which acts as a step-editor) which uses AMS music
: notation and then feeds it through MIDI. MMS was cool because it had 96
: voices!

: I wish I had MMS now because I am a SHIT keyboard player.

Glenn -

It's true that AMP 1.0 and AMP 2.0 were designed as POKEY players, but AMP 3.0 for the Atari ST is a MIDI sequencer. It does a damn good job at pretending it's a 128-track MMS with karaoke support. It also imports SMF, AMS, MMS, and AMP 1.0/2.0 files. If you have an ST, AMP 3.0 might interest you.

I do believe that AMP ranked up there as the best 8-bit Atari POKEY players, espcially after noise support was added in 2.0. At one point, I had a utility that ported over Phil Price's AMP songs, and I had "Passionately" running on my AMP 2.0.

By the way, AMP 4.0+ use a PC program I wrote called SMF2AMP that takes any standard MIDI file and converts it to an AMP file...

As far as your opinion on the 32X goes... ;)

Hmmmm... I dunno. Steven, you're the Sega guy, right? If you still have an Atari 8-bit (or access to one), try checking out some european demos.

I suggest these:
Halle Project 1993
Cool Emotion ("Hard" demo)
Bitter Reality
Sweet Illusions

From what I've heard of some of the early POKEY sound players, the new stuff (Sound Monitor, Benjy.. something, Chaos Music Composer) kicks major butt in comparison! :)

And of course, you'll like some of the neat graphics/animation going on too.. (Rzog Plasma anyone!?!?!?!?!)

All of these demos (and of course many more, including of course not-so-good stuff) is available at the Umich archives under "Demos".

From: kendrick@zippy.sonoma.edu
Message-ID: <3mvofs$1ct@nic-nac.CSU.net>
Source record: 92499

What the heck. UMich's full of beta software. :)

Let's now say that HyperIt! beta version 0.5 is pretty much up for grabs free software.

BE FOREWARNED:

1) Do NOT run it under SpartaDOS!!!!! Only MyDOS 4.5x will work!
2) Don't get too used to the thing, as future upgrades in the scripting language are of course going to happen.
a) Stuff to make it easier will of course be added (variables, esp.)
b) Stuff may be removed and redone (so 0.5 and earlier stacks won't work any more)

The file will be "hitb5.arc" at Umich. Dunno where it'll be put (a link will of course be in the "Newitems" directory :) that's so killer!!).

I hope to be able to upload it tonight (once whoever's on the PPP dial-up is done running Eudora hehe)

I have the following stuff for sale or trade. Best offers (cash or trade):

1 x 600xl (stock)
1 x 65xe w/SuperVideo/Audio (stock ram [for now!])
1 x 320k XE w/SuperVideo/Audio, socketed, ramdisk LED
1 x 400 w/split audio w/audio/video enhancement
1 x Indus GT drive
1 x Trak ATD4 drive (no slave) [may/may not function - havent tested]
1 x SX212 1200baud direct connect modem
1 x XEGS w/socketed ROM (was used as MUX slave) and light gun
1 x 800xl w/SuperVideo/Audio (FULLY socketed!)
3 x Wico Command joysticks
1 x XEP80 w/AtariWriter 80 and TurboWord 80
1 x Atari 1025 80col. printer
1 x Trakball

Software

PeachTree Accounting - Accounts Payable
C.R.I.S - Cash Register Inventory System
Fight Night
7 Cities of Gold
Video Title Shop
AtariWriter
Home Filing Manager
Sargon Chess w/tournament disks
Ghost Encounters
2 x Archon (1 is an original store DEMO copy)
1 x Archon II (the Adept)
Napoleon in Russia
Spy -v- Spy (1st)

Misc. Hardware
----
4 x 1meg SIMMS
Mosaic 32k upgrade card (400,800)
1 x 4meg 72pin SIMM
5 x 16bit PC multio-IO cards (serial/parallel/IDE/Floppy/Joystick)
2 x 16bit PC VGA video cards (512k-1meg onboard)
5 x 16bit PC MFM hardrive/floppy controller cards
2 line Uniden Cordless phone w/conference/hold/programmable (new!)

3413. Atari 800xl Emulator

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-18 00:00:00 UTC
From: albert@anlaps.aps.anl.gov
Message-ID: <albert-1804952232020001@anxpc03.aps1.anl.gov>
Source record: 92502

I did a Veronica directory search at the NYSERNET site using the search string "emulat*". I found a site which had an Atari 800xl emulator for the PC. I immediately downloaded, unzipped, and ran it. I was disappointed to find that all the text included in the package was in German!

Does anyone know of an Atari 8-bit emulator which is in English? Please reply here or send me e-mail.

Did a 320k upgrade on one of my 130xe's.. it previously only had
the AC SuperVideo and Audio mods - and worked flawlessly, but for some
reason after the ramdisk upgrade, I lost only the video that provides
the keyclick and BEEP in Bobterm after a download completion.

I still get full audio in games, but lost keyclick and the beeps and
whatnot that I normally got in term. programs, etc..

What circuit/resistor pack controls just that one audio function?

Any help appreciated.

I started it - just as a way to get some life into the group, as people
just seemed to be going on about piracy et al.

Personally I think that if someone wants to write a demo, then that would
be great, but it shouldn't take a competition to make them do it.

Just go to it, and write whatever.

Say, do we have a binaries group? E.g. alt.binaries.atari.8bit or something?
And if not, is anyone interested in creating one? Hmm, might ask my sysop
how you go about that. AFAIK it's much easier than making a "comp.sys"
group.

Richard =8-]

PS. No need to keep calling it Richard Morris's demo... I just suggested it.

The mortal William Kendrick wrote:

: There's also FlickerTerm 80 which uses a trick 80 column mode which Clay
: (and I at one point!) invented. (I never got it to work because I didn't
: know how to use VBI's in Action! at the time <sigh>.. if only, huh? ;) hehe)
: It uses Graphics 0 and two fonts, which get flipped back and forth (and
: other stuff happens to clean it up some) to produce a flickery (hence the
: name) 80 column mode. It ALSO uses display-list scrolls to speed it up.

Don't forget the PMG underlays for bold. That is a trick that often goes
unappreciated. It is quite innovative. A matrix of quad-width PMGs.

3424. SCSI drives on MIO's

Newsgroup: comp.sys.atari.8bit

Do scsi drives have to be 256byte/sector or 512? I ask this
because I can pick up a 114 connor (? not sure) for $50 used....
and its was pulled from an old mac. I need a SMALL drive... =)
and I want to get rid of this huge mfm-scsi contraption.

3426. Re: XFD/ATR files?

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-19 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3n27pb$ncs@nic-nac.CSU.net>
Source record: 92367

You don't need XFD or ATR files, even if you're running PC Xformer.
Just get a copy of DCM2DSK for the PC and convert the existing DiskComm
disk images into ATR disk images.

(Some things we NEED though are: a VOL to ATR converter, an XFD to ATR
converter (should be EASY- I wrote a simple hack in QBASIC for that
when I got the demo version of F.R.E.E.), and an ATR to DCM/VOL converter.)

Message-ID: <3n27v5$nir@nic-nac.CSU.net>
Source record: 92368

Hehehe... the only VIDEO you lost was key-click!? :)

Sorry :)

Umm.. hmm.. I wish I could help you- I'm a bit too lazy to rumage through De Re at the moment, but if you don't get help soon, I'll look it up if I can. The audio you lost is the 5th voice, I THINK it's also handled by POKEY, I'm not sure.

-bill
what a waste of bandwidth!

3429. Re: Atari 800xl Emulator

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-19 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3n289k$nmk@nic-nac.CSU.net>
Source record: 92370

Lemme guess. The file you got was AT800XL.ZIP. It contained an insanely HUGE "doc" file and QEDIT or HEDIT or something (which looks pretty cool, actually). When you load the doc, it types it out as if the person who wrote it were typing it in (typos and all) right there. The screen is 640x480 and the Atari area of it is a 1/4th-as-big-as-your-screen little box in the middle.

I'd like all the information I can get about this file.

As for the GOOD Atari 8-bit emulators, check out my FAQ which I'll post right now! :)

Summary of Atari 8-bit's an emulated 8-bit Atari's:

Atari 8-bit computers were produced between 1979 and 1987. The
major models released were the:

400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
1200XL - 64K, 1200XL OS, GTIA graphics
600XL - 16K, XL OS, GTIA graphics
```

800XL - 64K, XL OS, GTIA graphics
65XE - 64K, XL OS, GTIA graphics
130XE - 128K, XL OS, GTIA graphics
XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)

All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.

Branch Always Software are the creators of:
ST Xformer (Atari 8-bit emulator for ST's), Quick ST, Quick Index, Gemulator (Atari ST emulator for PC's), and PC Xformer (Atari 8-bit emulator for PC's).

ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines. Very limited. Now public domain (used to be commercial).
PC Xformer 2.0 and 2.5 released for IBM PC machines. 2.0 is limited and supports only 800 OS. Both public domain (were always PD).
PC Xformer 3.0 released for IBM PC machines. Supports all OSes, 320K RAM, and best of all, player/missile collision detection (which MANY games use!)

Graphics:

The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection (which is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).

Sound:

Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the
comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for
IBM / MSDOS based computers, the PC Xformer 2.0 (XF2 for short). Many
people in the 8-bit community had gotten, well, fed up with the XF2-based
questions which did not pertain to them, or to the really dumb questions
which were in fact understandable to new or rusty Atari 8-bit users, but
had just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions. Now it's becoming a fairly good reference (and got me the job
of writing the commerical 3.0 release's documents!).
This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
supplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).
Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0,
and 3.0, the first commercial release, have been released. It is assumed
that the reader has the latest versions of PC Xformer (2.5 or 3.0), although
if you have 3.0, I must say, those documents are great! (If you don't get
the joke, look at the name of the author of the manual, and look at my name.)

---=== Xformer Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System. Be sure you're in 800XL or 130XE
mode. (130XE mode is only supported by XF3.0, not 2.5, but there is
no real difference in the operating systems.)
A.2.2) It may not work under the XL/XE Operating System (rare cases), switch
to 800 mode.
A.2.3) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.
A.2.4) It might be a BASIC game! Be sure you're in BASIC and use the BASIC
"RUN" or "LOAD" (and then "RUN") command. Also, be sure it works

with the BASIC you have. Some programs only run in BASIC XL or XE
(which are both cartridge-based BASIC's not currently supported by
the Xformer), and some run with TurboBASIC XL (disk-based).
A.2.5) It may just refuse to run on the emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note:
on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported
on the XF2.5. You might have to shell out the $29.95 for 3.0!
A.4.2) (See Question 2).

Q.5) How do I exit XF and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS
parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR
are both DOS boot-disk-images and are both in the XF25.ZIP file or
on your XF3 disk).

Q.7) How do I use MSDOS files with XFormer?
A.7.1) Add the files to the command line and use them as their respective
drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XFormer which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XFORMER from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XFormer. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.
A.7.3) If you can, use the MSDOS program ATARIMG, which is much like
S2PC but has a nicer, more graphical (less-menu driven) interface.
(Unfortunately, this doesn't run on all IBM's!)

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XFormer and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the
XFormer (and the S2PC program mentioned above). .XFD files are used
by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC

Xformer (XF2,XF25,XF3).

Q.9) What's SIO2PC?
A.9.1) Refer to the XFormer and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act as though it were an Atari disk drive. (Up to four drives, actually). It uses disk image files (.ATR's) and can also let the Atari access single IBM files (much like XFormer does) as a single file all alone in its own disk. It also currently allows Print-Thru (all access to the Atari "P:" (printer) device can be redirected to the IBM's printer, screen, or MSDOS file; different translations/conversions are user-defined when the Print-Thru mode is turned on). Finally, with the use of two programs on the Atari 8-bit (the only two programs that currently have anything to do with SIO2PC that have been written (to my knowledge) for the Atari 8-bit), the IBM can be controlled remotely (commands are sent from the Atari, typing on the IBM is not necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS, and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most relevant to the less-knowledged/experienced XFormer users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS (4.50 and 4.53) presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or disk to another, just "<source>" copies from one place on one disk in a drive to the same place on another disk in the same drive (asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first) (add ">*.*" or ":*.*" after a subdirectory name to delete the files within it. A subdirectory name alone will delete the subdirectory (if it is empty and unlocked)). (Acts like both "del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful). (like "ren <old> <new>" in MSDOS - with MyDOS, use "," between old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like "attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with the current version of MyDOS you are using and also has the menu file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
[I] Formats a disk (add "/N" after the drive number to do a quick-format of an already-formatted disk (ie, just a very fast delete "*.*").

[J] Duplicate disk (copies an entire disk, including boot sector,
when using XFormer, it's much quicker to just copy one .XFD or .ATR
to another).
[K] Make binary file: saves memory and makes it binary-loadable. See [L].
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)
disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.

(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN
that normal directory, or even another subdirectory. For example,
you can have your disk divided up into the "GAMES" files, the

"GRAPHICS" files and the "SOUNDS" files. A directory of the disk
(the "root" or "base" or "trunk" directory) will simply list the
three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then,
if you ask for a directory listing of the "GAMES" subdirectory,
you will see the files (and perhaps other subdirectories) within
the "GAMES" directory. Think of it as a tree. For people familiar
with Macintoshes, "Folders" are simply subdirectories. A window
which appears when you open a "Disk" Icon is the "root", and all
of the "Folders" within it have more windows in them which also
have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes
are not necessarily using drive 1, and MyDOS and SpartaDOS may
already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current'
or 'default' directory to a different place (a different drive or
a subdirectory). "D:" can stand for "D1:" (like AtariDOS always
does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR
DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory,
files, multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS)
E: editior - readable, writeable. This is how input from the
keyboard and output to the screen is normally handled. If
you wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
G: graphics - writeable. This is not built into the Operating
System but must be loaded. This is an Epson-compatible printer
driver which can easily dump graphics.
K: keyboard - readable. This is just the keyboard. Input from
it is not 'echoed' back like with the "E:ditor".
M: multi-mouse - readable, writeable? This is not built into the
Operating System but must be loaded. This is a handler which
runs in the background and accepts input from either a mouse,
a joystick or a touch-tablet and displays a mouse pointer on
the screen.
P: printer - writeable. Send data to this and it will appear
on the printer. You can print files (documents, etc.) by
using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.

R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
W: Windowing (screens) - readable, writeable. This is a graphics
8 graphical windowing driver (rarely used, unfortunately!).
It must of course be loaded as well.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference
Manual). (As of Jan. 7, 1995, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum

COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)
Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is

inverse-ESC, or what would be the [ESC],[RETURN] combination. The
character exists, but must be set into screen RAM by hand. Oh well,
at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them.
When simply entering text, type [ESC] then the edit key and the
character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an
ESC beforehand, so first type [ESC],[ESC] to make an ESCape character
appear, then type [ESC] then the edit key and the character for that
edit key should appear. When the PRINT statement is executed, the
first ESCape (which you typed as two [ESC]'s) will make the editor
SHOW the following character (even if it is an edit character), then
the character which you entered (with [ESC] and then the edit key)
will make that character appear. This makes it difficult to align
a set of PRINT statements which make a multi-line picture or menu
which uses viewed edit keys. It is probably best to have all of the
lines in your program with the PRINT statements that can fit visible
on the screen, then edit them (without putting any of the ESCape
characters in, then when the picture looks like how you want it on
the screen, move the cursor to on top of each edit-key character and
press [Control]+[>] (Control-Insert). A blank space should appear
under the cursor and the rest of the line should move right. Now,
type [ESC],[ESC] and an ESCape edit-key character should appear
where the blank space was. When you are finished doing that for
each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE
PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1"
to turn on the no-edit mode (ALL characters except End Of Lines
will appear, even ClearScreens!) When you want to go back into
normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called
"Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE
series (and probably on the 5200 and 7800 but I cannot confirm this).
When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc)
minutes, the screen colors begin changing, thus protecting your TV
or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the
command "POKE 77,0" at least once every few minutes (IF the screen is
active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having
location "77" set to "0", or set location "77" to "128" with
"POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'

with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced

mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?

____
[note:] Someone please give more details or corrections here! Thanx!
~~~~~~~
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
board or account you have access to, and then connect the modem
to your IBM and download the files.
~~~~~~~

Q.3) Is there any easier way to get Disk Communicator (Atari disk image)
files to and from SIO2PC disk images or PC Xformer XFD disk images
other than using Disk Communicator 3.2 on my Atari! I mean, both files
are disk images! They're both on my PC's hard drive! <cry>
(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)
A.3.1) Yes! There's a new IBM program out called DCM2DSK.
(Why "DSK" and not "ATR"? To keep people from getting confused with
the ATR-8000(?)) The current version is '2' and it's available at
UMich's archives and probably elsewhere. Filename: "DCM2DSK2.ZIP" in
the SIO2PC directory.
A.3.2) There's also a new program which converts DCM's to XFD's. I need to
look at it myself first before I can describe it (or someone help
me, please?)

---=== Where to get or FTP files mentioned in this FAQ: ===---

The PC Xformer 2.0 and 2.5 can be downloaded from the "ftp.clark.net" FTP
site:
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)

PC Xformer 3.0 can be purchased for $29.95 (prices may vary) from:

>as you do the necessary modifications... It's absolutely painful for me
>to use the XE keyboard, even the spring type, and the 800XL is only
>marginally better.

I must heartily agree! After 10 years of an 800 and despising the 1200XL, I now love the beast, you can't beat it for hacking on. I have 2, one with every mod listed except the PBI (soon, soon) and my other for prototype hacks. I am near he end of Wooley's IDE HD hack, the drive works and reads/writes, but is pretty garbled at the moment, but is this sucker FAST! And it's only 2.5", 43meg. Soon as I figure out the PS problemn, it's going inside the good 1200. Bob also has a hack for an INTERNAL 3.5" floppy!

1200's are a joy!

Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,kw.general,comp.sys.atari.8bit

KWEST Atari User Group will have two tables at this Sunday's
Ontario Computer Fair. (Kitchener Memorial Auditorium, Sun.,
April 23rd, 11 am to 4 pm.)

Used Atari hardware and software will be available for sale. If
you too have Atari items for sale, bring them in early and we'll put
them on a table for all to see (and purchase).

For additional information:

Phone Brian at (519) 743-6455, or

email daroloson@neumann.uwaterloo.ca

Please tell your friends.
Please repost this message on local BBSes.

Thanks for your support.

Actually the keyclick is generated by, of all things, GTIA.
CONSOL (53279), which clicks the speaker when written to, is a GTIA
address.

>
>Why does everyone state that the XEP80 is slow??? I can get CLEAN 9600
>throughput using Bobterm on my 320k XE and an MIO.

Probably because the Bobterm docs suggest that Bobterm can't do above
4800 with an XEP80. Maybe the MIO makes the difference. I don't know.

>In fact, I'm online with Bobterm and my XEP80 at 9600 right now - reading
>these newsgroups.

Some people have also stated that you can't reliably do 9600 without
an MIO or Black Box. I've had no problems using FlickerTerm at 9600
for VT-100 emulation or (40-column) Bobterm at 9600 for file transfer
with just a plain ol' 850.

3442. Atari 1050 drive not working??

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-19 00:00:00 UTC
From: DJYF66E@prodigy.com
Message-ID: <3n3fcj$3024@usenetp1.news.prodigy.com>
Source record: 92383

I have an Atari 800 system with 1050 (HAPPY) drive that I am trying to undust and set up. I cannot find the manual for my 1050 drive, and cannot get the system to see the drive. I have tried all 4 switch settings on the back of the drive (I think), but I get the same results. When I turn on the drive, the activity light cycles on/off every few seconds. This occurs whether I have the cable plugged in or not. On the computer side, it comes straight up into notepad. I remember back in the dark past, that this was usually a configuration problem. Can anyone give me the correct switch settings for a 1050 single drive system so I can try to isolate the problem with some known information?? Thanks a lot for the help.

Andrew

If all of these formats were published then it would be easy to write
a conversion program for it. I could write one that would convert from
any format to any format, but I don't have any information on DCM, and I
have never heard of VOL, but XFD and ATR are published formats, that I do
know about. Of course the author of dcm2dsk will not shed any light on
the DCM format, but Bob Puff seems to be more willing, the only thing is
that I sent a message to him over 1 month ago, and have recieved nothing.

But others have talked to him (Ivan), I don't know if he just doesn't want
to be bothered or if he just hasn't had the time.

He said to Ivan that he had a BASIC XL program that would check the integrity
of an DCM, this program would be more than enough to decipher the format.

I've seen the FTe prototype unit in action. It was really neat - ST
owners coming by and shaking their heads, tech gurus coming by, pointing
and murmuring. Mt understanding is that once the software is finalized
it will be shipping... soon. (since not everyone would be willing to
re-assemble the partition table etc. Most would rather use some sort of
front end software.)

R >to try one of the PD assemblers available. Charles Marslett, author of
R >MyDOS, has one that mimics the Atari Macro Assembler & I've heard people
R >swear by John Harris's assembler. There's both assembly language programmers

When talking about assemblers that can be found at the archive, don't forget about the shareware program KASM by Ken Siders. I've just started playing with this one myself (after using MAE-93 so much that I put away my Mac/65 cart). It's been a while since I last did anything in Action!...kind of put it aside to play with CC65 a bit more (yeah, it's lots slower and takes forever to compile but it lets me sit at home and work on code I can use at Tulane).

3451. Percom Disk Drives, other stuff.

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-19 00:00:00 UTC
From: lymang@cybernetics.net
Message-ID: <lymang-1904952108270001@dsnine.cybernetics.net>
Source record: 92392

Anyone know if there is any electronic info on Percom disk drives? I now have two, after recent acquisitions, and have two major questions:
How do I arrange those little blue jumpers on the back to set one disk drive as 1 and one as 2 (or whatever) and also, can I combine 1 half height and one full height into one case? (they sure look like they'd fit, and the space it would save would be GREAT!)

Also, what differences in the computers would make certain disks WORK on my 800, but NOT on my 800XL? Any ideas? Is there some way to make the 800XL pretend it's an 800 so those disks would work? Could it be using the Percom did it? Maybe I should use the 810's?

BTW, I now have 3 systems(800/600XL/800XL), 5 drives (2percom,2 810's, 1 1050 w/o pw), and basic (on cart), some alternate DOS (OSS Version 2, I think), and many disks, 30 or so floppies of stuff, and some carts. I will need to try and get two systems out of this, if possible (wish me luck!)
I have read the FAQ, and read the newbie FAQ. Most of it doesn't apply till you have a DOS disk, which I'm not sure I do. (other than that OSS disk)
Oh, I also got a weird looking modem, it comes with a cart, and it plugs into the joystick port!! (at least it appears to!). It's 300 baud. This MAY mean I can start getting stuff off the net. I'm not sure how, quite yet, but fortunately I have a shell account with my ISP, so that should help. The only thing standing in my way, I think, is that I'm not sure the terminal software I would have on the Atari would have a protocol allowing me to download from my ISP, who probably only have Zmodem (and maybe xmodem/ymodem) running. Any ideas on this?

If some kind Atari 8 bit soul would like to send me a floppy with DOS on it, I would gladly arrange to either give them something from my growing stock (a joystick perhaps??) or pay them a modest fee for the disk/shipping. Anyone interested?
Private email correspondence preferred, but I'll talk to whoever is interested in talking!

Oh yah, I got Bruce Lee, one of my ALL TIME FAVORITE GAMES EVER! (I remember solving this one back in my freshman year of high school)
Yay!

Lyman; Sounds like the cart/modem you have is a MPP. I thought the term program that came in the cart would allow downloads, but everyone I've ever heard that used it complained about problems with it. I've been digging through some of my old stuff looking for some handlers for Matt, I've also got a copy of Express written specifically for the MPP. The handlers should allow you to run something like Bobterm with the modem & IMO Express was/is a great program & more then enough for a 300 baud modem like the MPP. If you want me to UUE the programs to you let me know, but don't expect them before the middle of next week.

i really need help. i need to get k65v37 or similiar on an atari disk
i've tried to download this from umich by gopher and email. the problem seems to be in
to be in the path. i must download to a vax at pstcc,from there upload
thru kermit to my school token ring (ibm), then i upload to the school bbs
and finally phone in from my atari at home to download the file! i need k65 to download
directly
download directly from pstcc to home atari. i have uudecode, although i hand
entered this, and arcx but program error occur when i try to unarchive. any
info would help or a bbs near east tennessee running atari. please mail any suggesti
suggestions or info to:
su_bbutler@pstcc.cc.tn.us
thanks for your help, i'm in desperate need.

No no no. A 1050 with an Ultra Speed Doubler. Even better is a 1050
with track buffering. The XF's have too many problems, incompatability
ROM bugs, (Only drive I know with the "Unstick XF" option), and poor
workmanship. Of course, if you upgrade and XF..then thats a different
story.. but the 1050 wins hands down.

Bertrand... :) Are you SURE they're ATR files this time!? :) Also, I think it'd be wise if someone (who DOESN't have tons of trouble with DIskComm and SIO2PC, like me) could convert this to a DiskComm .DCM file before it gets put on any FTP site or BBS, because MANY MANY more Atari users have access to DiskComm than to SIO2PC / PC Xformer! :)

3477. Wanted: a good book on programming the 6502

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-21 00:00:00 UTC
From: ziggy29@rahul.net
Message-ID: <3n94fh$3dp@butch.lmsc.lockheed.com>
Source record: 92256

I'd like some recommendations about a good book (or two) on programming the 6502. I have reference manuals, a list of the instructions and the opcodes, but I'd like something a little more in depth, preferably with a few worked-out examples.

If it helps to know my background...I have a little x86 assembly background (certainly not extensive) but the 6502 isn't the same type of animal; the x86 is more register-memory based and the 6502 is more accumulator-based. I've programmed the Atari with high-level languages, but never in assembly before.

There you have it. Know any good books? Do you have any to get rid of? Do you know where I can find them? (I'd imagine that most, if not all, are out of print.)

The Dorsett series are being sold now by "Assisting Children to Excel" a non profit group in California. They match disadvantaged kids with old computers and software. They're asking $7 for the "master cartridge" required for any of the series, plus $40 for a set of tapes on a particular subject. Their address:

Assisting Children to Excel

Message-ID: <1995Apr21.151359@ccr.jussieu.fr>
Source record: 92324

I apologize for having sent this binary here.
I read the news from a PC computer, and I only read what I want to read. So I'm not bothered by very long messages. I don't read if I'm not interested.

I understand that this is not the case for everybody.
I'm really SORRY for the inconvenience.
I APOLOGIZE and won't do it again.
No harm was meant.

But.
- There is no binary newsgroup for atari 8bit.
- I've posted a message some time ago asking if I should post these disks here, and the only people who answered said OK, go on. ONE person telling me not to do it and why would have been a sufficient reason for me not to do it.

In fact, I suspected there was something wrong with this, but wasn't sure. That's why I've asked. People told me to go on, and that's what I did.

Sorry.
Anyway, I hope you all enjoy FREE (and buy the commercial version, of course).
Bye.
Bertrand Le Roy

3488. Adventure International titles?

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-21 00:00:00 UTC

You might try Future Systems, Inc., 21634 Lassen Street, Chatsworth,
California 91311, USA. They bought the rights to Indus drives. Maybe they
still have parts. (they developed an Atari ST version of the Indus GT, called
GT-1000 too.)

v >collection. And don't start flaming with sentences like :
v >"No, not me, never, ... "
v >
v >Vladimir
v >vjancare@magi.com

What did I win?!?

I'm against turning commercial software into PD, freeware or whatever.
Yes, I too like to walk into the store next door and buy 8 bit software off
ythe shelf, maybe even try it out before I buy it. But I can not. Doesn't
mean I can rip everybody off. What about Best, B&C, ATV, etc., etc. Look
at the FAQ. Loads of companies still supporting us. And yes, I have to
MAIL ORDER. I'm in the NETHERLANDS, EUROPE. I only have a bicycle (yep, I
have to sweat to get somewhere), my swimming isn't fantastic. And I can't
fly either. So I have to MAIL ORDER if I want something. And I have to
wait six weeks or more, before an International Postal Money Order clears.
I don't have a credit card (they check your income here before you can get
one).

And NO I do NOT have a single piece of pirated software!!!

So, you lose the bet!!

b >bjcorr@delphi.com

Still inthere Ben

Check the Self test.
There are even folks that have put 4 switches in there XL/XE case and they work
fine. Just a matter of connecting the right wires to the right places.
Maybe somebody could post a description here. It's really quite easy. As long
as you can see the F1 to F4 keys during the selftest. (Newer XE computers
have a slightly different selftest, don't know for sure if they removed the
whole F1-F4 code, or just the selftest portion in the Newer machines (which
seem to be VEEEERRRRRYYYY rare in the US and Canada))

v >Date: 31 Mar 1995 18:23:56 GMT

stuff deleted

v >I wouldn't mind making soft for Atari for
v >FREE if I had necessary HD & SW.

To make software for the Atari 8 bit you need patience, knowledge, an 8 bit Atari (or emulator) and some way to save you program. A cassette recorder (they sometimes give those away) would do, but since you're on here I guess you have a diskdrive, which makes things easier.

Come to think of it, if your a really good programmer, you could do most of the programming on whatever computer you want, using a word processor. You only need the 8 bit Atari to test things out.

v >Why is it that soft for C64 is freeware? That is probably the most important
v >reason for me to see all 8bit soft freeware. I can get games like
v >Boulderdash, Montezuma's Revenge and practically all games for 8bit (except
v >perhaps the ones made by Atari) for free from many sites on the internet.

Your right about Dorsett being the manufacturer/distributer of the educational tapes. The local Atari Club has almost a complete set of them (many tapes) but has lost some to walk aways and never got quite all when available. They are neat but you do need the 410 or 1010 recorder and copying them with a standard tape recorder doesn't seem to work well as I've been told.

c >
c >I would like to buy an XE complete in box. Used is ok if in very good
c >shape, or would buy new if anyone knows of any distributers. Thanx

B&C ComputerVisions:

65XE $105.00
130XE $175.00
XEGM $ 95.00
XEGM plus Lightgun, Joystick & software $139.00 (probably BugHunt & FS2)

Toad Computers:

65XE $ 49.00
130XE $ 99.00
XE GM Sys $ 59.00

B&C ComputerVisions has a "reconditioned" section in their ad. The computers
mentioned where in the other section.

Toad Computers says something about buying up used hardware, but doesn't
specify if the prices mentioned are for NEW or USED stuff.

(info found in ATARI CLASSICS)

Howdy Eyvind

Yeh, they hear words in KinderGarden and use 'em all day.

Maybe I SHOULD register my copy of PabQWK. It's far from bug free, but
atleast I can use a TWIT file.

Howdy Folks

This is too much.
People are leaving this group, just because to idiots think they can say and do whatever they want without taking into consideration what other people feel or think.

I don't know how kill fills work. I've heard that QWK readers can use a TWIT file. The QWK reader will then take out all mail by certain people. unfortunately this happens after you receive your mail, so you still have to pay for this BS.

Can we ask our providers to sift out messages by certain people?

Maybe we should start our own petition and send it to the sysadmin(s) of both Artem and Vlad. Why should we have to pay?

Maybe somebody who knows his/her way around InterNet, could collect all the non-sensence and foul language these guys have spread here and send it to their respective sysadmins. Please keep in mind that we might need these msg's in the future. They have more then one address.

I think it's time to come into action!!!

If I thread starts after this message I will answer it.
All other msg's from or to Artem or Vlad will no longer be answered as of right now.

>>avoid using.

I used to be a SysOp using Carina][2.5 and I made lots of mods for it
(I am Dr. Wiz or X-Droid, you may remember me). Carina][was the BEST BBS
software, bar none. I had Express Pro and it was good, but it could not be
set up like Carina can. In Carina you can do anything you want, its all basic
programming and batch files, you can program anything you want you can even
program online remotely and even enter spartados remotely. My BBS was the
Outer Zone BBS here in ST. Louis, Missouri. Carina was slower than pro, this
is common knowledge, but it was the ultimate. Then David Hunt got into the
picture (this guy is a pathological lier), dont believe anything he says, its
a total lie. PC BBS's have come a long way, but there is nothing on the PC
like Carina][with its flexiblity.

BTW, PRO is still going but what ever happened to OASIS with Glenda
Stocks? She went PC and I havent heard anything from her since...

I have built the interface and need a bit of help guys.
The voltages just don,t match the Testing section of the instructions :-
DB9 Connector.
Pin 9 = 9v (mine - 8v) Pin 2 = -9.4v (mine - 8v)
The RS232 pins are as follows:-
2 = + 8v. 6 = - 8v. 7 = - 8v. 14 = -8v.
I have checked and double checked for bridges,stuffed capacitors
etc,even changed the 232,still the same.The only difference between the
schematic and my attempt is the type of Diode used,the one I obtained is
an MBR150.
ifave Vrrm Vf
1A 50v 0.75
which the dealer assured me met the specs of the BYV10-30.
Any suggestions would be gratefully received.

Hey all you FlickerTerm fans...

I'm MAYBE going to be officially releasing the latest update of FlickerTerm in the next week or two (Version 0.4). I haven't made as much progress on it as I'd like (still no protocols), but have added a few features that make life with Flick a little easier.

Before releasing this thing though, I'd like your help. I need two things:

Suggestions-- Are there any cool features, no matter how strange or insignificant, that you'd like to see added to Flick? Don't be shy... you're talking to someone who added ROT-13 decoding on a lark!

Bugs-- When the first rev of Flick was officially released, rumors were flying that it was incompatible with MIOs, R-Times, Sparta, Sparta X, etc etc... Haven't heard much about this lately. Anyone still having problems? Mysterious crashes? Lockups? Let me know!

Thanks in advance to everyone for their cooperation.

Actually, Telix terminal software has what looks to be a VERY nice C-like scripting language. You can use it to do QUITE a bit, including creating a BBS (or editing an existing one).

I used to run the BBS which came with it - but only to screw around with it and to send files back/forth with a friend.

If I wrote a BBS nowadays, it's be command-line based but of course would included programs to present the common user with all of the standard BBS menus and stuff.

: software, bar none. I had Express Pro and it was good, but it could not be
: set up like Carina can. In Carina you can do anything you want, its all basic

As long as 2400 baud was the standard modem speed in the telecom arena, Carina was a good BBS (when it was stable) but not today. The only reason Carina is still being run by sysops is the fact that within the insulated 8-bit world, 9600 and above is the exception and not the rule due to the now-horribly-inadequate 850 and P:R:. Fewer people have MIOs or BBs (which was the main reason I kept on pestering Bob Puff for the never-to-be-released R:P:--AFFORDABLE 19.2K hardware flow control SIO interface...).

But these days, with 8-bit users being few and far between, 8-bit sysops usually find themselves servicing a mostly non-8-bit callerbase, and even 8-bitters these days (like myself) call on a different machine for the ANSI and the high speed and such. So I would never put up a BBS and force people to drop down to 2400.

By the way, you have quite a reputation in the Carina circle.

I think Shadow blacklisted you for some reason. I forget the details, but you are definitely on his bad side.

I think he said something about how you were responsible for ACE BBSs pulling out of the crossnet (the now mythical ACE bulletin board system which Shadow claims is being used a lot in international locales).

3530. PC Xformer Problems!

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-22 00:00:00 UTC
From: toby@cyberspace.com
Message-ID: <3nc09q$h27@case.cyberspace.com>
Source record: 92271

ARRG! I think PCXformer is nice, but I wish that they'd fix the alignment
problem and have SB/ADLIB sound emulation, instead of PC speaker. It
would also be nice to have it read DCM images and load multiple files
into the same disk...I.E.:
Files: BOB.EXE, AUTORUN.SYS, BOB.DOC, COWS.BBS
Commands (currently) to load onto disk:
XF25 DISKNAME.XFD BOB.EXE
(copy to D1:)
XF25 DISKNAME.XFD AUTORUN.SYS
(copy to D1:)
...
Anyway, it would be nice to be able to put them all into one file with an
external utility, like this:
FILE2XFD /DENSITY:0 DISKNAME.XFD BOB.EXE AUTORUN.SYS BOB.DOC COWS.BBS
Where DENSITYs are: 0 = Single, 1 = Enhanced, 2 = True Double.
Can anyone write me a utility like this? Maybe even with the capability
of converting archives to disks:
FILE2XFD /DENSITY:2 /DEL /ARC THISPROG.XFD THATPROG.ARC
^^|^ ^^^^^^^^^|^^ ^^^^^^^^^|^^
Specify Archive Mode Create Decompress
Where /DEL deletes the archive afterwords, and /DENSITY creates a 90k,
135k or 180k disk. It would also be nice to change an XFD to dos files,
when it's not a boot disk, that is, and maybe even write the VTOC and
rebuilding info into a file (not really useful), so that someone could
take those files and make a replica of the original disk. Anyway, I guess
that the subject sort-of changed while I was writing this, l8r.

Hello,

I acquired an Atari 800 recently and this disc software is surplus. All of these programs load, but I have not actually played them. They are original and have original docs and packaging as marked.

I'd rather sell them as a set and make somebody a great deal, or trade them for 8-bit cartridge sofware (I need most anything, but prefer arcade conversions).

Prices are $3 each, plus diskette mailer ($1) and postage (varies on quantity). If you buy all 17 disks for $30, or make me a cart trade for everything I'll include shipping by Priority Mail.

Thank you, Scott.

3533. A "homecoming?" Your opinions...

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-23 00:00:00 UTC
From: da_pate@pavo.concordia.ca
Message-ID: <23APR199502402928@pavo.concordia.ca>
Source record: 92274

Schools all around the world routinely have homecomings. They are a way to bring back alumni for reflection on the school.

The Atari 8-bit was used as a training ground for thousands of prorgammers and comp sci personnel around the world. Many of them are on the 'net. So I thought: why not have a homecoming here for them? I've written up a brief blurb, and compiled a list of groups to which it could be sent. I've tried to limit the groups to comp.*.programmer.misc, so as not to Spam. Any feedback? If I don't get any real negative reaction by this Wednesday night (say 21h00 EST 26 Apr 1995) I will go ahead.

Message follows:

Everyone got their start with computers somewhere. For some, it was a card reader, for others a fleeting glimpse of tape reels. But for many others "computer" will always bring back images of the Zylon fleet attacking your bases in Star Raiders.

If that's you, then comp.sys.atari.8bit would like to welcome you back home. If you got your start with the Atari 8-bit line, the 400,800, xl or xe, whether you're Bob Polin, Doug Neubauer, Russ Wetmore or John Doe, we of comp.sys.atari.8bit would like to hear from you. Stop by and say hello. Tell us what you've been up to lately. And maybe dust off that old 800 for another round of Star Raiders, or Preppie, or Blue Max, or MULE, or Archon, or...

Suggested distribution list:
comp.os.ms-windows.programmer.misc,comp.os.msdos.programmer,
comp.os.os2.programmer.misc,comp.sys.amiga.programmer,
comp.sys.next.programmer,comp.unix.programmer,comp.sys.newton.programmer,
comp.sys.mac.programmer.misc,comp.sys.atari.programmer,
comp.sys.acorn.programmer

That's it. Your thoughts?

The Sweet 16 is a small plug in board that replaces the 6502C CPU on your Atari xl/xe computer. It consists of a WDC 65816 on top, with a 65729 (I think) on the reverse of the board. TO mount it, you must either use inline machine pins, or cut out the middle of the existing socket. The board is well designed and clean; the pins are gold. Once installed, it works exactly like a 6502, unless you're running '816 code. Thus far, the only '816 software I've got is MAE... and until I find a decent reference, I won't be writing any '816 code.

I got mine as a show special; list price is $69.95. Oh, and I suppose I should mention this to KMK: SI.COM thinks that it's a 6502, but the speed graph display becomes messed up when running with the '816. I get gibberish pixels the width of the screen along that line. Replacing the 6502 provides a proper display.

I'm still looking for more '816 help, but so far even with almost no software I'm very satisfied.

In a message dated 3-14-95, Byron Followell said:

"You wouldn't happen to have a copy of this article or
know which issue it was from would you?"

I found the issue in question. It turned out to be the October 1990 issue of
Radio-Electronics, rather than Modern Electronics.

Reply with your address in e-mail, and I will take the mag to work and
make a photocopy of the article and send it to you.

About the only extra work that would be required is a sync separator.
The project outputs composite sync, and the Atari SC1224 monitor expects
inverted separate horizontal and vertical sync.

Inverse is a problem because there is no way to have "half" an inverse character. See diagram below:

AN inverse 3l would look like this as the 2/30ths of a second pageflip?

l character, right shifted and inversed:

```
xxxxxxxx
xxxx x
xxxxx x
xxxxx x
xxxxx x
xxxxx x
xxxxx x
xxxxx x
```

3 character, left shifted and inversed:

```
x xxxxx
xx xxxx
xxx xxxx
xxx xxxx
xx xxxxx
xxx xxxx
xx xxxx
x xxxxx
```

When you flip these, the blank portion which outlines the characters should appear as the background, right? WRONG. THe extra "lip" of the inverse essentially "fills in" the characters via persistence of vision.

So instead of the characters appearing as the background, they appear to be inbetween the brightness of the inverse pixels and the background. If you have the characters totally bright (thus making bold useless) then ivverse characters will be 1/2 contrast and that's about as readable as you can get it. If you drop the brightness down a little bit so bold can take effect, then it will be even less than 1/2 contrast and will be harder to read.

There is NO problem with non-inverse characters because no "filling in" occurs with the unlit pixels.

People have to realize that we're still talking about 2 sets of 40 collumn fonts, and if you inverse a character, you are inversing 2 80 collumn characters, whether or not the terminal tells you to. This leads to the "inverse lips" hanging off the edges of the inverse boundaries...

>of disks.

Hi Jim,
I did the same thing, bought a new package from American-TV. I have no answer to your problem, just a comment on a similar expeience. Both my copies refuse to let me into the Damian & Pythias shop right by the entrance. I get the same message over and over
'Insert Disk 3 side A'.I have to re-boot and forget about going in the shop. You didn't ask the program to backup disk #1 side #1 by mistake did you? I did that once and suffered the attacks by the 2 FBI agents for awhile until i used a sector editor to f
ix the problem.

(Problems J.King and somebody responded, with AR.)
I gotta say that you IGNORE the docs and DO put a write protect tab on the original disks(disk? I don't remember). I do remember putting the write protect on, and making a backup of side two and putting that in drive 2. I also routinely make a Disk Wizard backup, even if it snarks forever, of any significant commercial disk I have. Worst comes to worse, I can restore the good sectors. With double sectoring and other bs, this will not always work. It sounded like J.K. made a 'Archiver' or 'Happy' backup that was somehow thwarted by Price's copy protection. So to end this long story, DO put a write protect tab on side one. I must say that I haven't progressed far enough into the game to say that it absolutely will not effect the game, but frankly, if Price made it so that you MUST allow writes to the original disk, then I really give a big rats patooty about the game. By the way, Bob Puff's 'Black Patch' refuses to run on my ICD doubled 1050, and I don't think it is an accident. Egos and greed or bs and crapoony.

Summary of Atari 8-bit's an emulated 8-bit Atari's:

Atari 8-bit computers were produced between 1979 and 1987. The
major models released were the:
```

400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
1200XL - 64K, 1200XL OS, GTIA graphics
600XL - 16K, XL OS, GTIA graphics
800XL - 64K, XL OS, GTIA graphics
65XE - 64K, XL OS, GTIA graphics
130XE - 128K, XL OS, GTIA graphics
XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)

All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.

Branch Always Software are the creators of:
ST Xformer (Atari 8-bit emulator for ST's), Quick ST, Quick Index, Gemulator (Atari ST emulator for PC's), and PC Xformer (Atari 8-bit emulator for PC's).

ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines. Very limited. Now public domain (used to be commercial).
PC Xformer 2.0 and 2.5 released for IBM PC machines. 2.0 is limited and supports only 800 OS. Both public domain (were always PD).
PC Xformer 3.0 released for IBM PC machines. Supports all OSes, 320K RAM, and best of all, player/missile collision detection (which MANY games use!)

Graphics:

The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection (which

is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).

Sound:

Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the
comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for
IBM / MSDOS based computers, the PC Xformer 2.0 (XF2 for short). Many
people in the 8-bit community had gotten, well, fed up with the XF2-based
questions which did not pertain to them, or to the really dumb questions
which were in fact understandable to new or rusty Atari 8-bit users, but
had just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions. Now it's becoming a fairly good reference (and got me the job
of writing the commerical 3.0 release's documents!).
This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
supplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).
Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0,
and 3.0, the first commercial release, have been released. It is assumed
that the reader has the latest versions of PC Xformer (2.5 or 3.0), although
if you have 3.0, I must say, those documents are great! (If you don't get
the joke, look at the name of the author of the manual, and look at my name.)

---=== Xformer Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System. Be sure you're in 800XL or 130XE
mode. (130XE mode is only supported by XF3.0, not 2.5, but there is
no real difference in the operating systems.)
A.2.2) It may not work under the XL/XE Operating System (rare cases), switch

to 800 mode.
A.2.3) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.
A.2.4) It might be a BASIC game! Be sure you're in BASIC and use the BASIC
"RUN" or "LOAD" (and then "RUN") command. Also, be sure it works
with the BASIC you have. Some programs only run in BASIC XL or XE
(which are both cartridge-based BASIC's not currently supported by
the Xformer), and some run with TurboBASIC XL (disk-based).
A.2.5) It may just refuse to run on the emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note:
on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported
on the XF2.5. You might have to shell out the $29.95 for 3.0!
A.4.2) (See Question 2).

Q.5) How do I exit XF and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS
parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR
are both DOS boot-disk-images and are both in the XF25.ZIP file or
on your XF3 disk).

Q.7) How do I use MSDOS files with XFormer?
A.7.1) Add the files to the command line and use them as their respective
drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XFormer which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XFORMER from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XFormer. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.
A.7.3) If you can, use the MSDOS program ATARIMG, which is much like
S2PC but has a nicer, more graphical (less-menu driven) interface.
(Unfortunately, this doesn't run on all IBM's!)

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XFormer and SIO2PC manuals for details on these files.

A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the
XFormer (and the S2PC program mentioned above). .XFD files are used
by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC
Xformer (XF2,XF25,XF3).

Q.9) What's SIO2PC?
A.9.1) Refer to the XFormer and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XFormer does) as a single file all alone
in its own disk. It also currently allows Print-Thru (all access to
the Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced XFormer users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS (4.50 and 4.53) presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).

[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XFormer, it's much quicker to just copy one .XFD or .ATR
to another).
[K] Make binary file: saves memory and makes it binary-loadable. See [L].
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another

using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)
disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current' or 'default' directory to a different place (a different drive or a subdirectory). "D:" can stand for "D1:" (like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory, files, multiple devices (up to 9 on MyDOS and newer SpartaDOS, 8 on AtariDOS)
E: editior - readable, writeable. This is how input from the keyboard and output to the screen is normally handled. If you wish to type a small file up by hand and have it sent to the printer or a file, use "E:" as the source.
G: graphics - writeable. This is not built into the Operating System but must be loaded. This is an Epson-compatible printer driver which can easily dump graphics.
K: keyboard - readable. This is just the keyboard. Input from it is not 'echoed' back like with the "E:ditor".
M: multi-mouse - readable, writeable? This is not built into the Operating System but must be loaded. This is a handler which runs in the background and accepts input from either a mouse, a joystick or a touch-tablet and displays a mouse pointer on the screen.

P: printer - writeable. Send data to this and it will appear
on the printer. You can print files (documents, etc.) by
using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
W: Windowing (screens) - readable, writeable. This is a graphics
8 graphical windowing driver (rarely used, unfortunately!).
It must of course be loaded as well.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)

BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference
Manual). (As of Jan. 7, 1995, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:

COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,

not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)
Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is
inverse-ESC, or what would be the [ESC],[RETURN] combination. The
character exists, but must be set into screen RAM by hand. Oh well,
at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them.
When simply entering text, type [ESC] then the edit key and the
character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an
ESC beforehand, so first type [ESC],[ESC] to make an ESCape character
appear, then type [ESC] then the edit key and the character for that
edit key should appear. When the PRINT statement is executed, the
first ESCape (which you typed as two [ESC]'s) will make the editor
SHOW the following character (even if it is an edit character), then
the character which you entered (with [ESC] and then the edit key)
will make that character appear. This makes it difficult to align
a set of PRINT statements which make a multi-line picture or menu
which uses viewed edit keys. It is probably best to have all of the
lines in your program with the PRINT statements that can fit visible
on the screen, then edit them (without putting any of the ESCape
characters in, then when the picture looks like how you want it on
the screen, move the cursor to on top of each edit-key character and
press [Control]+[>] (Control-Insert). A blank space should appear
under the cursor and the rest of the line should move right. Now,
type [ESC],[ESC] and an ESCape edit-key character should appear
where the blank space was. When you are finished doing that for
each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE
PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1"
to turn on the no-edit mode (ALL characters except End Of Lines
will appear, even ClearScreens!) When you want to go back into
normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called
"Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE
series (and probably on the 5200 and 7800 but I cannot confirm this).
When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc)
minutes, the screen colors begin changing, thus protecting your TV
or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the
command "POKE 77,0" at least once every few minutes (IF the screen is
active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having
location "77" set to "0", or set location "77" to "128" with
"POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is

format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?

____
[note:] Someone please give more details or corrections here! Thanx!
~~~~~~~
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
~~~~~~~

board or account you have access to, and then connect the modem
to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image)
files to and from SIO2PC disk images or PC Xformer XFD disk images
other than using Disk Communicator 3.2 on my Atari! I mean, both files
are disk images! They're both on my PC's hard drive! <cry>
(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)
A.3.1) Yes! There's a new IBM program out called DCM2DSK.
(Why "DSK" and not "ATR"? To keep people from getting confused with
the ATR-8000(?)) The current version is '2' and it's available at
UMich's archives and probably elsewhere. Filename: "DCM2DSK2.ZIP" in
the SIO2PC directory.
A.3.2) There's also a new program which converts DCM's to XFD's. I need to
look at it myself first before I can describe it (or someone help
me, please?)

---=== Where to get or FTP files mentioned in this FAQ: ===---

The PC Xformer 2.0 and 2.5 can be downloaded from the "ftp.clark.net" FTP
site:
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)

PC Xformer 3.0 can be purchased for $29.95 (prices may vary) from:

3542. Re: A "homecoming?" Your opinions...

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-23 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3ncvnt$hea@nic-nac.CSU.net>
Source record: 92283

Heh-heh-heh.. going to post it JUST before your e-mail address changes, huh?
Perhaps you're anticipating the ever-present flame throwing us 8-bitters
get (of course, not often from ex-Atari-8'ers, but from people who either
got into computing (or were BORN) after its era, or were into C=64s or AppleIIs
back then. :))

Good luck! Neat idea!

1) Who's KMK
2) What's SI.COM
3) My guess as to the problem (gibberish on a scan-line)..
65816 is >99%< compatible with the 6502.. I believe all it misses is
NOP (no-operation) - the time-wasting command. Some demos/graphics displays
(GED, Our5oft demo, Sweet Illusions demo bio intro, etc.) use the NOP
in part of their HORIZONTAL display list change trick (ie, Graphics 8 on
the LEFT half, Graphics NINE on the RIGHT!!)).

I think that when I get a Sweet16, I'll be needing another 800XL and a PAL800XL
(finally :))...

A few things..
1) cool ideas!
2) you CAN do this:
XF25 disk.atr file1.com file2.txt file3.arc file4.obj
copy 2 to 1, copy 3 to 1, copy 4 to 1, copy 5 to 1
3) Atari disks can (with the standard, popular DOSes) support up to 16MB disks. 180K is pretty small nowadays! :)
4) Get S2PC or ATARIMG. They're PC programs which let you do this and that to/between ATR disk images and your PC's files.
5) Get DCM2DSK - makes converting DCMs into ATRs MUCH easier! :)
6) Use ATRs :) They're much more flexible :)

I would just like to see Ymodem and a scroll back buffer.

In addition, what's the chance of making an XEP80 version (send
everything to E:)??

I know it defeats the purpose, but it would remove all that
flickering by putting the graphics through the XEP80.

Just an idea..

3548. Home security via Atari XEGS

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-24 00:00:00 UTC
From: jeking@xmission.xmission.com
Message-ID: <3ng8dh$dun@news.xmission.com>
Source record: 92205

I'm thinking about creating a home security system using an extra XEGS.
What I have in mind is this:

I run wire out to the gate at the front of my house with magnetic sensors
or something. If the gate is opened, the system will recognize this and
put forth a little alarm.

Has anything like this been created already? No sense in duplicating
effort..

Not a big deal, but not very cheap. I was talking to one of the guys
who run TWAUG yesterday, and he was saying that someone recently
asked them if they could do this. Unfortunately, although the
equipment would be pretty cheap, the postage costs would be
horrendous ... especially for a TV.

I've just heard of something that might interest users of NTSC
machines. One of the club members in the States has come up with a
hardware hack that will allow US Atarians to run European software
without any problems (apparently). He's set to start advertising it
soon (if he hasn't already done so. I'm trying to catch up with my
Easter mail :-)

If that was all there is to it, then we'd all have done so. Trouble is that I, for one, have no way of testing if something works on an NTSC system anyway. So if I did want to write something that was 100% compatible, then I'd have to fork out on importing a TV from the states, getting it rigged with a 240V - 110V power adaptor, and get an NTSC Atari to run on it.

Alternatively, I could try guessing if something would work or not :-)

Ok, you said "TV" picture. Now, this could mean TV vs. monitor, right?

If the monitor output is also b/w (and I'm giving a 50/50 chance that
the knob I'm talking about ONLY controls TV output - so even if the mon.
output ISN'T b/w) then check the little knob inside on the motherboard.
If I'm right, when you flip the 800XL upside down (keyboard farthest
on the desk/floor/whatever), you can get to it with a little screw-driver
through a hole on the case on the far left corner (ie, near the left SHIFT
key if it were on top). Remember, this is a guess. The 1200XL's in the
center.

Anyway, this controls some sort of color control on GTIA I think and I
remember that if it gets turned too far, pictures go B/W.. Again, I only
played with this a long time ago when I was using RF output on my 1200XL,
so I dunno if it does anything to monitor output.

Now, if it's JUST monitor output that's B/W (which it seems you DIDN'T say),
then, esp. if you have a 4-plug monitor cable, you could be hooking up
Luma into the monitor instead of Video.

Good luck!

Mathy, just read an article about the Jaguar in a gaming mag where they interviewed Sam Tramiel. I aggree with you that I would be nice to have a consolidated ![MS DOS, Mac] computer, but the tone of the article seems to be "it won't be attempted by Atari". The way Atari is structured now is everything is made by somebody else, Atari buys it & puts their labels on it (really at the factory <g>) & makes their money by charging a premium over what the manufacturer charges. Sam said the current computer market is too cutthroat for Atari to compete. If penny pinching Atari can't compete, it doesn't look good for anybody.

Ben; Actually while the $D100 line is in the ROM region, it's part of the
2k hardware hole from $D000 to $D7FF. Currently, there's nothing in a
1200XL at [$D100, $D600, $D700] so it literally points to air. The Atari
uses pull-up resistors on the data lines so anytime you look at one of these
holes, it'll read $FF since there's no ram/rom/hardware chips to exsert
anything else. It sounds like there may be a typo or two in the file.
Bob may be using the Phase 2 clock on pin 39 rather then an A2 line on
36 or whatever. I've got a few minutes to proof the file if you want to
send it to me.
Rick

I once wired up a connection to my door so that the Atari would think the joystick button had been pressed whenever the door was open. With an 800, you can get 20 such connections, along with 8 light sensors (which are read like paddle controllers). Or maybe 24 connections--it's been a long time since I've dealt with what the different pins are for. (Half those numbers for an XL/XE)

Anyway, that should be sufficient for a simple security system.

I have what is obviously some sort of printer adapter (centronic connector on one end) with a 9 pin "D" connector on the other (joystick port). There is no name or number on the box. I suspect some software (which I might have if I knew what I was looking for) must be run to make the thing work (neither BASIC nor DOS recognises a printer with this thing plugged in to any joystick port). Does anyone recognise/want this thing?

The Next Monthly SwapMeet will be on Monday, May 1st at 7 P.M.

WANTED: Dealers to sell at Upcoming Swap Meets. Dealerships sought
fall into such Categories as Computer Dealers, all kinds. All kinds of
Computer HardWare, SoftWare, Peripherals & Accessories for ALL Computer Makes
and Types.

Also Sought are Dealers in Video Gaming Equipment, such as Video Game
Consoles, Cartidges, Video Game CD Players and Video Game CDs. ALL Video Game
Makes and Types. ALL Video Game Consoles, Cartridges, CDs, Peripherals &
Accessories.

Also Wanted are Dealers in ALL Types of Electronics.

WANTED are Dealers in Ham Radio, CB Radio, Music CDs and other
Recorded Music. Stereo Equipment also Wanted.

Also Wanted are VCR's, Video Tapes (NO PIRATED MEDIA OF ANY KIND,
PLEASE!!), TVs and Satelite Gear.

This is an ALL Computers, Game Machine and Electronics Swap Meet!!

Small Businesses, and all Dealers Welcome and Wanted!!

NO PIRATED ITEMS PLEASE!! NO PIRATED ITEMS PLEASE!! NO PIRATED ITEMS PLEASE!!

NO ADMISSION CHARGE!!! PLENTY OF FREE PARKING!!! NO ADMISSION CHARGE!!!

TABLES $10! CALL FOR RESERVATIONS! REMAINING TABLES, FIRST COME, FIRST SERVE!

Swap Meet Location in Portland, Oregon. USA. At 1819 N.W. Everett St.
at the NorthWest Service Center On the First Monday of each Month.

To find out about more about the Swap Meet or Table Rentals.
Reply in E-Mail to bensmith@teleport.com.

Some. I have been working on Bob Wooley's IDE hack for the 1200XL. I am using a 2.5" 43meg Toshiba so it can go inside the 1200 when I'm done. So far;
The drive responds to the computer, ACTS like it is working perfectly, but is reading garbage. Part of the problemn at the moment is a lack of time to REALLY sit down and work on it and some ambiguities in the article (or just my plain stupidity!) One problemn seems to be that the IDE is seen by the 1200 as 9 registers (for data, status, I/O, etc.) which needs to sit at $D1xx. As we all know, this is part of the OS rom. No problemn, switch the ROM to RAM. Now all signals required are on the CPU except for $D1xx. Bob writes, "For that, I lifted pin 34 of the 6502 and brought it ($D1xx) over from pin 14 of U18, the 74LS138 on the motherboard." Lift pin 34? Isn't this R/W? This signal is needed to talk to the hard drive. Lift the pin, lose R/W! (All the signals are tapped off of the CPU itself.) The article also ssays to pull A2 off of 6502 pin 36. Isn't pin 36 n.c.? Hmmm... I lifted pin 34 and ran a jumper to pin 14 of U18 and the drive responds, but garbage. Hmmm.... This is the main confusion at the moment, that and my questionable soldering skills. I have to leave to Arizona for the weekend (work) and so won't get back to this project till Monday, but I will come crying for help or howling with delight next week and let you know how it's going. It may be reading junk right now, but it is formating and writing and it is fast! And the price is right. About $5 in parts and $40 for the drive!

Now if I can get this thing to work. Hell, Bob did, so it can be done.

>fit, and the space it would save would be GREAT!)

Take out that SS/SD FH drive and place it in the nearest garbage can :)

Your percon drive can control upto 4 drives. Using MYDOS all percom
drives can operate 3.5" drives quite easily. If you have a SD drive
you will get 360k per disk, if DD you will get 720K per disk.

My percom has 2 720k drives mounted inside the case, running off the
Percom power supply and have had no problems for 2 years now.

As for the jumpers, just set the jumpers so that the drive you have NOW
does work and then leave them alone. You can select the drive number
by setting it on the floppy drive. (i.e. device 0, 1, 2 or 3)

If you have any more questions feel free to e-mail.

KMK is the guy who put togther the SDXPACK.ARC at Umich - I recently got SDX, and it's incredibly useful (both the cart and the pack). There are utilities to calculate the CPU speed (MIPS.COM), floating poit math speed (FLOPS.COM), editor speed (QE_TEST.COM). There's a Fast Floating Point OS for installation as a RAM OS, an E: accellerator that crashes my system, and SI.COM, the System Investigator, which will tell you the OS revisions, whether or not internal BASIC is present, RAM (both normal and XE) and CPU speed. It's the CPU speed line that's messed up. Other demos that I've seen don't have any problems, and I believe that there is still a NOP with the '816. For more info on the '816, check out Ivo van Poorten's homepage.

I have 3 monitors that I use with my 3 XEs. One monitor has an audio input resistance of 10k ohms, another monitor is 5k ohms and another is 89k ohms.

I bought another monitor which is 75 ohms. I measured the resistance at the audio output of my XE. It is 1.5k ohms. I'm afraid to plug it into the 75 ohms.

I put a 10k ohm resistor in series with the two but alot of hum appeared.

What is the lowest resistance that I can plug into? Thanks.

Heck, I'm running on a Sweet16 board and have no problems. Remapping
character attributes would be nice <g>, since that way I could show all
the inverse as bold, which wouldn't have the overlap that glenn was
discussing.

I doubt any pirate will suddenly sit up and go "hmm... maybe they're right. I'd better trash my 2000+ games collection." I doubt there is much to fear on the subject of old games being lost (some pirate will have them) the only worry I have is of new games being lost. That - I believe - is the main argument against the freeware/piracy arguments. There may not be a sackload of games appearing but the 8-bit is certainly not extinguished yet.

There are some of us programmers still out here and if all we're going to get is a pat on the back for all the sleepless nights and rushed meals to get that piece of software finished then that's fine. Loyalty is one thing; being a sucker is another.

- Joel G.

Andrew; You're right about pin 14 being the !ENABLE pin for the $D100 area.
As far as pins 4&5 being wired together, these are both !E pins for the
74LS138. I only have 800xl schematics, but I'll assume these are tied to
the $D000-$D7FF hardware decoded output of the MMU. On at least the 800xl,
they just tied one of these lines to ground while the other remains connected
to the hardware decode. I guess they wanted to reduce the load on the MMU &
it has no effect doing it this way other then the load. Just a guess, but
in reading some of Bob's articles I believes he refers to "lifting the xxxxx
signal" from [pad, pin, what have you]. In all likelyhoodm, this is what he's
refering to rather then bending out pins.
Rick

The voltages you got sound OK, from experience, wiring a MAX232 wrong will pull the voltages to about 1/2 of specs. As far as the diode goes, I almost always use 1N914 switching/small signal diodes. They only handle about .2 amp, but that's probably 100 times more then you need. The forward voltage of these diodes is lower then most power diodes. Another problem I've had is the ground & logic ground signals are not always compatible in every cable I've used. I'd try using the 'other' ground from whatever you're doing now. You should be able to see the logic levels switching from the SIO2PC menu if you have almost everything hooked up right. All else fails, you can always have me repost my 74LS00 version, it's a little easier/quicker to make & you should have 1/2 a cable left around anyway<g>.

3585. Rom Scanner for 8-bits

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-25 00:00:00 UTC
From: MBITDC9306@titan.newi.ac.uk
Message-ID: <9504251332.AA24803@dylan.newi.ac.uk>
Source record: 92226

I'm finally about to get to work on a Rom Scanner unit for the 8-bit.
It was designed for me back in 1993 by Jason Keane
(jkeane@ugmail.eeng.dcu.ie) and allows up to 8 ROMs to be connected
to the Atari at once.

I've made my own minor modifications to the design and on an 800XL,
there's a small hardware hack to fit. I think I may be able to get
away without the hack on a 130XE - just trying to find out.

The units can be daisy-chained to allow you to connect at many ROMs
as you like and the ROMs are simply selected by pushing a few
buttons.

How much interest would there be in such a device amongst the games
players and cartridge collectors amongst you? Don't worry, there's
also an on/off switch so that you can run your disk and cassette
collections without any problems :-)

The 1200XL had four function keys (F1-F4) in addition to Start,
Select, Option, Help, and Reset. It also had the Break key up there with
the function keys.

3588. Mac 65 help

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-25 00:00:00 UTC
From: ivan@rcp.co.uk
Message-ID: <cDRnvA7GBh107h@rcp.co.uk>
Source record: 92229

Hi,

I have got the Mac 65 cartridge and instruction for my Atari, although using PCs all day I though it would be fun to play with the file M65V42 from the atari archive. This file is supposedly a version of Mac 65 for the PCXFormer.

My question is: when I am using my cartridge I will assemble my program and type DDT to go into the debugger and test the program. When I try this on M65V42 it says "what!". Is it posible to run/test/debug my program without resorting to binary saving it and running it from DOS.

Thanks

Ivan

Hello everyone!
While searching an ftp-site for an PC-Program i found ATARI 8-bit
resources. Since i have an still good running 800XL with 5.25" Disk-Drive
i wondered, wether there are programms for PC's fro formatting the 5.25"
PC-Disks in an 800XL readable format, so i can exchange datas between my
computer systems.
Any suggestions welcome (if hardware would be necessary i need the
software for usage also).
Thanks! Frank

Nope.. 11 function keys (4 of those are "F-keys", ie, true function keys >:^))

Like I said before: Reset ... Start / Select / Option / F1-F4 / Help / Inv / Break

that's 11!

Tsk tsk Glenn.. remember, we have 4mb nowadays. :) And IDE hard drives
<cough cough>, and 16-bit CPUs and 4096 colors (albeit a little low res hehe).

'course, a PC friend of mine say Zybex (160x96x4 res. playfield gfx) and
thought it was 320x200x256! Hahah! :)

I'm beginning to think that giving the numbers (80x192) is a mistake-
just show it to them and give them the # of colors. :)

Sounds good to me -- then at least those with OCR could grab the TIFF
and convert to text, then upload that.

DDT is only in the cartridge version, while I believe that is based on
the original disk version. It's been a long time since I've looked at
it, but I think there's a program called BUG65 on there.

Definitely a 1200xl keyboard.

If you want to connect it to another Atari,and you have WWW access,
look at "http://www.cis.ohio-state.edu/~funk/Atari/".
I put up an article there that you may find useful. I still have to
convert the drawings from TIFF to GIF format, but I did get the
article and tables converted to text.

I have a disk written by an Atari 1050 drive. I wrote
a BASIC program to read a file on it one byte at a time,
and only the first 256 bytes belonged to that file.
The other bytes were garbage or belong to other files.

I figure that what ever data structures ATARI DOS 2.5
uses got trashed on this disk. If any one has some
suggestions for retrieving the data on this disk,
please let me know.

: Some. I have been working on Bob Wooley's IDE hack for the 1200XL. I am
: using a 2.5" 43meg Toshiba so it can go inside the 1200 when I'm done. So
: far;
: The drive responds to the computer, ACTS like it is working perfectly, but
: is reading garbage. Part of the problemn at the moment is a lack of time to
: REALLY sit down and work on it and some ambiguities in the article (or
: just my plain stupidity!) One problemn seems to be that the IDE is seen by
: the 1200 as 9 registers (for data, status, I/O, etc.) which needs to sit
: at $D1xx. As we all know, this is part of the OS rom. No problemn, switch
: the ROM to RAM. Now all signals required are on the CPU except for $D1xx.
: Bob writes, "For that, I lifted pin 34 of the 6502 and brought it ($D1xx)
: over from pin 14 of U18, the 74LS138 on the motherboard." Lift pin 34? Isn't
: this R/W? This signal is needed to talk to the hard drive. Lift the pin,

No, pin 36 is R/W. Not sure what ping 34 is.
A2 is pin 11. Just check out the table of pin outs on the next page
of the article. My question is, in his schematic he has pins 4 and 5 wired
together on the 74HC138 and then the wire goes to D1xx. Um..where
is D1xx? that pin 14 of U18?

I'm not sure why things are going on here the way they are. I am
making the assumption that he is taking the hardwired hardware line
and running it to the unused ram.

I went through 3 '232's when I first built mine, I was suprised at how
sensetive the chip was to my incompatence! I finally found out that this
was the case by using a breadboard and mounting the chip and the caps,
giving it 5v and ground and checking the voltage at pins 6 (-10v) and 2
(+10v). All the bad chips failed the test. When I got a good one, I
finished the circuit on the breadboard, checked again (got -9.4v and +9.4v
this time) and it worked! Then I got out the soldering iron.
The 232's are easily damaged by the ham fisted (in my experience) and
should be checked for the correct voltages BEFORE attaching the inputs.

Alf holds the rights to it and has a new version which is probably about 80% complete but he gave up on it and will probably never release it and he has essentially washed his hands of Oasis support duties.

What some other poster said was true about the Oasis situation vs. Carina. Carina is withering on the vine similar to the way Oasis did, from lack of timely support and updates.

I've got a rant I want to make about Computer Chronicles.

When the IBM PC came out in 1984, the Computer Chronicles guys were just starting, and they must have creamed their jeanes over this hunk of garbage.

For as long as I can remember, the Computer Chonicles with head-geek Stuart Chafe' (sp?) {you know, the guy with a bird's nest of hair combed over his baldspot} and the software reviewer Schindler {the classic computer geek with a mercifully bearded face that only a mother could love and a beanbag-chair physique} treating the "PC" as the ONLY real computer. Even back when the ST and the Amiga were considered viable alternatives, like up til 1987, CC was towing the PC line.

I almost fell out of my seat some time in the late 80s when I saw them do a review of Cad Cam/animation software and they showed some Atari ST stuff. It was truly a once in a lifetime event to see them cover an Atari product. And of course, the industry-news portion rarely mentioned companies not 80x86 related.

These days they cover more kiddie stuff than they used to, and they DO give some token MAC support, but it always seemed a foregone conclusion to them that everyone had a "PC with DOS". I don't think they even reviewed any alternative operating systems that were competing with Microsoft before they were crushed into the ground....

Definitely a show for the "mainstream" and we should be duty bound to ignore them since any coverage they would give on the 8-bit would be filled with negative and condescending or humorous attitude, like "look, how quaint, thank God we've gone beyond 64K and 1.79mhz" rather than "look, hardware sprites and scrolling, this is something that has paved the way to todays custom GFX asics like the Playstation". These are people who have bought into the "brute-force and bloat is best" mindset from Micro$loth and Intel.

EC>in
EC>the next week or two (Version 0.4). I haven't made as much progress on it
as
EC>I'd like (still no protocols), but have added a few features that make life
EC>with Flick a little easier.
EC>
EC>Before releasing this thing though, I'd like your help. I need two things:
EC>
EC>Suggestions-- Are there any cool features, no matter how strange or
EC>insignificant, that you'd like to see added to Flick? Don't be shy...

I use Flick on an 800XL with a P:R:C and SDX, but it seems very picky
as to which handler I use. Right now, the best one seems to be PRC.SYS.
I've tried using the built-in handler with the SDX RS232, but it doesn't
seem to be very stable - probably thanks to the P:R:C - when entering the
term everything seems to freeze.

Other than that, I'm open to about any feature!

Yes

> I'm not sure why things are going on here the way they are. I am
>making the assumption that he is taking the hardwired hardware line
>and running it to the unused ram.

Yes, in order to give the IDE registers the D1xx area to reside in and to
set aside the $D600 - $D7FF area to hold the code for the IDE driver in a
safe area of memory (can't get much safer than the ROM area!) Right now I

am just running the code out of RAM due to some uncertainty in Bob's instructions. I am trying to get an answer from him.

Well, all they do is use a feature of the standard 17xx series FDC chip. It allows two extra "sector type" bits to be recorded along with each sector when you write it. When you read it, the bits are available in a status register.

Atari just defined one of the four sector types as "normal" and another as "protected". Since there was a separate CPU controlling the floppy drive, they could just make it not know how to write "protected" sectors.

The point of Happy drives is that they have disk controller software that DOES know how to write protected sectors. So copying a normal copy protected disk is simple. I don't know if any other copy protection methods were used on Atari disks, but I doubt it.

Also, you could copy the disk using an old TRS-80, since they had direct control of their FDC chip. I plan on eventually writing a bunch of disk utility programs for my Model 4, both with "bit copying", and file translation. Atari disks should be no problem for it. :) (The TRS-80 can even switch density in the middle of a track, to allow formatting a "double-boot" disk!)

FYI, most of the various TRS-80 DOSes used the sector type bits to mark directory sectors. If it tried to read the directory and didn't find the mark, either the head was on the wrong track, or a new disk had been inserted with the directory on a different track. Either way, it was time to get back to track zero and see what was wrong.

(Disclaimer: This info is from the POV of someone who grew up with TRS-80s, not Ataris. That's why I don't know if any other copy protection methods were used. I prefer cartridges these days anyhow.)

3620. FlickerTerm

From: ehalliwe@emh.kunsan.af.mil
Message-ID: <9504271125.AA15838@emh.kunsan.af.mil>
Source record: 92113

From: stronae@rice.edu (Kenneth Ryan Matheis)

> There have been problems with FlickerTerm and Sparta, and (can I be

Please be more specific. What problems? With what setup? Seems some people can run Flick under Sparta (disk-based and X), and some can't. Anyone know why this is?

> tomatoed for this?) let me just whimper "Dialing lists! Dialing lists!"
> That alone would make life much more bearable.

No "Dialing Menu" per se, but there's something in there now that serves the same function. <hint>

> (Is it me, or is inverse-video kinda hard to read on FlickerTerm? Right now
> I'm using a b/w teevee, so that could be the source...)

It's not you. Inverse is very hard to read.

From: bosco@host.yab.com ()

> How 'bout an ATASCII font? Betcha never thought of that!

Nope. If you want to call an Atari board, use BobTerm. It'll do a much better job at ATASCII than Flick ever could. My goal with Flick is to make it the best VT100 terminal it can be... NOT some all-singing, all-dancing, but ultimately half-@ssed terminal.

From: James King <jeking7@delphi.com>

> I would just like to see Ymodem and a scroll back buffer.

Ymodem-- I'm hoping Tom Hunt will be able to provide me with a Ymodem module.

Scrollback buffer-- Once I implement a capture buffer, we'll see. Bear in mind however that I'm down to 13K of free RAM at this point. Further development on Flick may come to a screeching halt simply due to running out of space!

> In addition, what's the chance of making an XEP80 version (send
> everything to E:)??

Zilch.

> I know it defeats the purpose, but it would remove all that
> flickering by putting the graphics through the XEP80.

And I could remove the flickering AND get all the IBMASCII characters by ditching the Atari and rewriting it on the PC!

By adapting Flick to the XEP80, I would have to completely replace huge chunks of code, modify about half of the rest, and the end product would be slower and useable by a smaller number of people.

This is a GOOD idea??

From: da_pate@pavo.concordia.ca (PATERSON, DAVID ANDREW)

> Remapping character attributes would be nice <g>, since that way I could show
> all the inverse as bold, which wouldn't have the overlap that glenn was
> discussing.

You can count on attribute remapping being in there. It won't be user friendly, but it'll be in there.

Whoa James! What do you need to know!? You know how to use the BASIC
"STICK()" function, right? Do you know how to extract certain bits out of it?
(Actually, if you work it just like a joystick: 4 inputs either on or off,
you don't need to twiddle with the bits (except for speed if you're in like
Action! or assembler):
IF S>4 AND S<8 THEN - right button pressed
IF S>8 AND S<12 THEN - left button pressed
IF S=13 OR S=5 OR S=9 THEN - down button pressed
IF S=14 OR S=6 OR S=10 THEN - up button pressed
and..... whoops... well, not "all combinations", but a certain set of
combinations are handled there :) up/down/left/right/diagonal.. that's
only 8 + 1 no buttons = 9. There are 7 more (including ALL of them down)..
I guess you will need to do some binary-"and" operations... :))

Anyway, if it's OUTput you need to learn about, well, most everyone here
with a copy of De Re or Mapping (probably Mapping) can tell you how! :)

It's all pretty simple actually (at least, that's what I keep telling myself
hehee)

As I understand it, there are at least four ways in which software was copy-protected on the Atari 8bits:

1. The used-sector table (sector 360) is incorrect, so DOS's duplicate disk will skip needed sectors. Many sector copy programs will deal with this.

2. The program checks to see that there is a bad sector (unformatted, or otherwise returning an error code) in a particular location on the disk. I know someone came up with a simple hardware modification to allow writing of bad sectors, but I don't know where the documentation on it is. [This is what they used for Ultima IV, the last of the series released for the 8bit.] There may have been modified versions of this scheme where the sector contained useful data, but still returned an error code.

3. The disk has two sectors that both claim to be the same sector, so the program re-reads the sector until it happens to get the other copy. [I think this was quite rarely used.]

4. The disk is formatted with different interleave on different tracks, so as to produce different access times for the tracks. These programs generally required the Happy enhancement to copy them, as it was able to detect the formatting and duplicate it.

Now what I would like to see is a method for representing this copy protection information in disk image files, and then to have SIO2PC able to emulate protected disks. Then I could put my old 810 into storage. (It should be relatively simple to tack on a table listing sectors with error codes, and only a little more complicated to specify a seek delay for certain sectors.)

3627. "Protecting" copies of protected software

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-26 00:00:00 UTC
From: ziggy29@rahul.net
Message-ID: <3nlnom$sud@butch.lmsc.lockheed.com>
Source record: 92120

I've got a few software titles which I haven't seen available commercially anywhere. One of my mortal fears is that either through my own carelessness or a 1050 run amok, some treasured game which is very hard to find these days will no longer function.

As insidious as "doc-check" copy protection is, and as much of a pain in the rear some of it is to use ("Page 53, line 27, word 5..."), at least you can make backup copies of your software.

I doubt that many of the software manufacturers who offer a replacement policy for a nominal price (usually $5 to $10) are doing this anymore. In other words, if some of this stuff fails, it's all over. You either learn to live without or you try to find another copy of it somewhere.

I've dug up Ultima III recently (currently looking for the other Ultimas made for Atari, hint hint), and I have not seen this title available commercially anywhere. What do I do if the disk fails to boot in the future? With copy protection schemes as I know them, I can't make a backup for archival purposes. Also, I paid $29.95 for one game fairly recently, and I don't want to pay another $30 should it fail (if I can find it at all).

(Actually, in the case of U3, I bought it used at B&C a couple of years ago, and the twit who owned it first used the *original* player master disk as his/her scenario disk. Sheesh.)

Another issue, of course, is a desire to place copy-protected software on a hard drive. Have any of you done this? Are there tools which allow you to do this?

This is a touchy subject, due to the P-word, but it *is* a real concern for many of us who want to keep enjoying our software long into the future. How have some of you out there learned to adapt to this limitation? Can the inability to duplicate program disks eventually lead to the death of some titles, as disks slowly wear out and stop booting?

I hate to even bring this up...but I remember crunching a couple of game disks for the 8-bit back when you could easily find replacement software and when the software companies could replace disks for a few bucks. I haven't mangled a game disk in my 8-bit renaissance yet... but I know it's possible and that I may have no recourse when it happens.

And I'm proud to say that I have *never* possessed a copy of commercial 8-bit software which wasn't legitimate. Just thought I'd

throw that in as flame retardant.

3630. Emulator for PC?

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-26 00:00:00 UTC
From: Leon@lfheller.demon.co.uk
Message-ID: <798936624snz@lfheller.demon.co.uk>
Source record: 92123

Does anyone know of an Atari 8-bit emulator for the PC? A friend of
mine is looking for one. I've searched through the Simtel and CICA
stuff, but couldn't find anything. I've seen Apple][, Mac and TRS-80
Model 1 emulators, so it should be feasible.

errr, just a small detail here... its 60/50 Hz, not Mhz. 60Mhz is almost
FM frequencies... :)

That would be funny, 50 Mhz on my local power network... who would need a
modem then ? :)))

Tim; at least for UIII, I know you to be of good character so if your disk goes bad or you want to put it on hard drive just let me know. As far as commercial cracks go, *everybody* seems to like Chipmunk. It's still pretty pricey but if I was still into games, that'd probably be how I'd go about protecting my investment.
I *loved* UIII! It's funny you mention it because there was just a thread in comp.sys.ibm.games.rpg about it. People were telling how they had never figured out about going to Ambrosia via the whirlpool: Everytime they were sailing around & got sucked in, they shut off their computer. Doing things like killing Lord British with the ship's cannon, building a walkway with boat at the entrance to the Isle of the Silver Snake so they could Moongate there with a horse & outrun all the battles. Game came with a nice cloth map & several books of Runes. I think San Jose Computer seperated me from something like $49 or $59 for that one when they were still on Blossum Hill Rd. I'm thinking of buying the UI-UVII CD ROM for my clone as the only ones I have are II & III on my Atari & 7 on my clone.

Ok, I was at the SSU Computer Club meeting yesterday, and noticed the door to the "room o' junked Suns" was opened. Now, this is where this machine (the "Zippy" Sun Unix box I'm on at the moment) is kept.

I looked at it and noticed this logo.. it looked a lot like an Intel logo, but it said "Satan Inside"!!! WOW! COOL! I screamed about it, and a few of the CClub members went in to look and were as impressed as I.

I sit back down and we go on talking about whatever it is we were talking about (either comics or Beavis & Butt-Head... yeah, it was one of "those" meetings...) and the Sysadmin / does-a-whole-ton-of-other-stuff, Brian walked in and set down a peice of paper with nine more "Satan Inside" logos and a pair of scissors (and walked back into his office on the other side of the hall). :)

So, to make an extremely long story short, I cut one out for myself (as did quite a few others) and last night I taped it to my 800XL on the upper right-hand corner. Hehehehe... pretty cool, huh?

I'd like to, when I get my Sweet-16, make a "Sweet16 Inside" logo not unlike this one (and the "Intel Inside" and the "Intel Outside" logos, of course :)) and replace the "Satan Inside" one with it..

That'd be cool!

(Oh yeah, the REASON the Sysadmin had a bunch of "Satan Inside" logos, other than because he's cool, was because he was trying out the Unix program "Satan" (some security thing) and it happened to come with a Post-Script file with those logos in it! :))

Neeato!

The methods you described were some of the most crude form of copy
protection (along with just not formatting a track). Things such as
syncronized tracks (aka "skew alignment"), 18-25 sectors per track,
"weak bits" and physically modified disks (e.g., laser holes) were the
more advanced techniques and (at least the last 3 methods) were not
covered by using TRASH-80 copier.

Things like this would require a combination of a Happy Drive, Copy II
PC Option Board and other hardware.

This method was so crude that I don't know if that even merits as
"copy protection", but I guess in the strictist terms it is.

>2. The program checks to see that there is a bad sector (unformatted,
>or otherwise returning an error code) in a particular location on the
>disk. I know someone came up with a simple hardware modification to
>allow writing of bad sectors, but I don't know where the documentation
>on it is. [This is what they used for Ultima IV, the last of the
>series released for the 8bit.] There may have been modified versions
>of this scheme where the sector contained useful data, but still
>returned an error code.

There are simple hardware modifications including a switch that would
change the drive speed. Writing with a slower than average drive
speed would cause the sector read back by a normal drive to CRC error
out. This method again is quite crude as the error wasn't truly
reproducable -- sometimes you'd have to attempt this a few times to
get a legit copy.

>3. The disk has two sectors that both claim to be the same sector, so
>the program re-reads the sector until it happens to get the other
>copy. [I think this was quite rarely used.]

This was done quite a few times. This method required using a more
advanced hardware copier CHIP, not merely modifying the existing
hardware. Identical sector IDs with different data. Expanding on
this was placing more sectors per track (up to 27+) with usually
smaller than 128bytes/sector to fit them all. This (beyond about
22-23 sectors/track) was difficult (impossible) to reproduce with the
Happy Drive as it was not a bit copier. Some people tried slowing the
drive RPM down to allow the Happy to write more sectors/track, but it
never worked very well. At this point, Happy threw up its arms in
surrender and didn't truly "copy" the disk, but "emulated" the copy
protection beyond about v5.2 of HBP.

>4. The disk is formatted with different interleave on different
>tracks, so as to produce different access times for the tracks. These
>programs generally required the Happy enhancement to copy them, as it

>was able to detect the formatting and duplicate it.

This was called "skew alignment" on the HBP. A very crude
implementaton of this was done in v3.8/3.9. A very good
implementation of this was done is v4.0. These synchronized tracks
relied on the relative position of sector 1 on track one to other
sectors on other tracks (and their order within the track itself!).

>Now what I would like to see is a method for representing this copy
>protection information in disk image files, and then to have SIO2PC
>able to emulate protected disks. Then I could put my old 810 into
>storage. (It should be relatively simple to tack on a table listing
>sectors with error codes, and only a little more complicated to
>specify a seek delay for certain sectors.)

Some of this would be fairly easy to do; others would be more
difficult. Especially things like the timing of synchronized tracks
relies on things like the access speed of the 810 drive head, baud
rate of the drive, etc. that would be much faster on a hard disk.
Other things (like unformatted tracks) that merely return an error
code would be a lot easier. I don't see it happening. Atari
protection (especially from companies/people such as Electronic Arts,
Synapse, and Phillip Price were especially nasty and cutting edge for
the time).

Yep, also known as "weak bits". HBP couldn't touch this legitimately.

> 7. More than 18 sectors per track. This is common on an Enhanced density
> disk where 21? sectors are used. The drive must be physically slowed
> down in order to write more than 21 sectors per track.

Less than 18 sectors/track were used too. The 810 must be slowed down
to write this but certain custom hardware copiers (e.g., COPY II PC
Option Board and another hardware copier that plugged into the top of
the memory expansion slots on the 800 that I only saw advertised in
one of the first ANTIC/ANALOG magazines) could do this by speeding up
the data writes without slowing the drive RPM.

> 8. In addition to "BAD/MISSING" sectors, there are Soft Errors, such
> as bad CRC bytes, deleted data marks, etc..

> 9. I actually think there is a LONG sector.

> 10. There are still a few more...

Definitely.

> BUT I WOULD BE INTERESTED IN THE TRS80 COPIER!

A COPY II PC deluxe option board does a lot more. The TRS-80 copier
would only do things like unformmated tracks and the crudest sector
errors. It was great for the earliest copy protection schemes, but
wouldn't even do the earliest EOA releases like Archon or M.U.L.E.

Just got back from Arizona on buisness and I discovered an Atari dealer I never heard of before. They are Games+ and they had a good assortment of 8bit hardware and software, NEW in the box software! I couldn't believe the amount of old Atari titles still in the box and new! They also had a good selection of used hardware. Every 8bit computer commonly made (NEW in the box 65XE's) even an XEGS, XF551 drives for $40!!! Yes, they work! (got one)
Also picked up the newsletter of the local Users group NWPAC, it is good. Had reviews of Ice-t, news about FTE, and an article about the just completed Textpro 5.20 manual, done by the clup prez Dale Wooster. 106 pages printed front and pack in NLQ type, spiral bound with full front and rear covers and plastic protectors, full color cover, all for $12 that INCLUDES priority mail! $6 more get you a 2 disk set of 5.20 ready to run, $4 more get you additional macros, setup instructions, etc. I ordered mine today. Games+ is at;

Games+
610 N. Alma School Rd.
Chandler, AZ 85224
(602) 963-1961

Order the Textpro Manual from;
Dale Wooster
7113 Pasedena
Glendale, AZ 85303
The NWPAC sponsers a BBS at;
(602)278-8505 (PAUGS)
It is open to all, special perks for NWPAC members.

Yes, I learnt from this book it was really good. I'm sure Tom Hudson's
Boot Camp series from Analog magazine would be a great help too.

Two gripes with the COMPUTE! book - it does avoid a few useful instructions
(I have in mind BMI and BPL which I use all the time) and it does advocate
the use of "kernels" - using private OS routines - which can lead to
incompatability problems.

That reminds me... does anyone out there know what the overflow (V) flag is
for in relation to ADC and SBC??? Something to do with signed multi-byte
addition but that's all I have ever found out.

3650. More Disk Copy Protection Methods.

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-27 00:00:00 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK

Source record: 92141

There are numerous disk copy protection methods that have been used on the Atari 8-bits, those four that got posted a day or so ago are only just the tip of the Iceberg!

There are two main forms of protection (apart from copyright laws!), these are designed to
a) Stop you copying the disk and/or
b) make it not worth your while to copy the disk.

Category a) methods include Bad sectors, Phantom sectors, Fuzzy sectors, duplicate sectors. All of these rely on software detecting (or rather not detecting!) data on certain sectors of the disk. Most of these sector formats can be copied using the various Happy, Archiver etc upgrades for your 1050. One of the most ingenius methods I have heard of is actually making a tiny hole in the disk at the exact position of a certain sector, it requires some very precise calculations and formatting but there's no way you could do such a thing on your system at home! The software then checks for lack of any and all signal at this sector and if it finds any it refuses to boot etc. I'm not sure if this method has actually been used on an 8-bit Atari, but I have heard rumours.
Another way (which was adopted by Databyte) is to time how long it takes to read x number of sectors. If it takes less or more time than expected then the software assumes you have an upgrade fitted and refuses to load the software. This has an unfortunate side effect that the software won't run on an XF 551 which spins at 300rpm as opposed to the 288rpm of a 1050. There are a few games of this nature, Flight Simulator II, Spy-v-Spy I, Polar Pierre and Aztec as far as I can remember.
I have also heard that recent European methods check to see if a disk is write protected, if it is it refuses to load. If it isn't it then goes on to check for the 'bad sectors' etc if they are not present then it formats your disk assuming you have a pirate copy!!!! Also some recent software has serial numbers on the disk label and stored on the disk, while these don't prevent copying they can be very useful in tracking down the source of the piracy!

Category b) methods include the 'find the code on page 33 of the manual', input the necessary code by translating the code number into a sequence of characters using the supplied coloured conversion sheet. Another way is to put the manual on red or orange paper which then makes it hard to photocopy. These methods usually work best when software needs extensive documentation.

Other methods include the dreaded Lenslok, by placing your 'Lenslok' device over the 'garbage' displayed on the screen a code was revealed which you must enter correctly for the software to run. This was dreaded because the Lenslok was easily misplaced and the software companies were obviously not too keen to replace them!
Also as dreaded was the dongle which was used on (the UK version of) Leaderboard. This plugged into the joystick port and the software checked if it was there, if not the system crashed on you. It was only a connection between two pins but that wasn't common knowledge at the time.

Anyway thats my brief roundup of copy protection techniques, if you want more info whole books have been published on the subject, most notably those by Alpha Systems, called I believe Copy Protection Techniques and Advanced Copy Protection techniques.

The emulator you require is called PC Xformer. The most current version
is 3.0 (I think) but a slightly older version is available free (It was
on a cover CD in the UK - This month I think - PC HOME ?) Version 3
costs #30 (??) and is available fro Micro Discount (See tha FAQ for details).

Anyone know where I can get hold of some empty cartridge cases from?
Also, I don't suppose that there's anyone supplying Atari cartridge
connectors (cartridge ports)?

Do you know of any vendors that still sell the Happy enhancement for 1050 drives? I've recently unpacked my 130XE system and there's lots of old software I have that I would like to back up. Would American Technavision carry the upgrade? I haven't seen it in their flyer. I guess I could just look for a 1050 that's already Happy enhanced, but I have 2 1050's and don't need yet another one.

: >eventually lead to the death of some titles, as disks slowly wear
: >out and stop booting?

: Upgrade your 1050 to a Happy, then you can back up ALMOST all your (c) software.

: For me, I've done two methods. 1) Everything is backed up via Happy 7.1 and 2) Almost
everything I have
: is archived off to Atari hard disk, PC hardisk, tape backup (via PC hardisk) and on
ftp/BBS sites.

I've never had a happy... but I have a 1050 Duplicator. Why isn't this
mentioned in the FAQ? The 1050D is nice, damn fast, and copies
just about everything I own. I think the latest version of the software
I have is 5. It even has the slow mod upgrade to copy more than 21 sectors
per track. It can copy EA's track mesh stuff as well.

Okay..most if not all the hardware is used.. They are just a little
shop or 3 that carry used stuff. They have plenty of 8bit titles
used and new..but mostly used and all in the box.

They have as of this post: 400's $25, 800's $40, 800XL $45, 600XL $35,
XF551's were 40 but are now sold out, 1050 drives (about 13) at $40.
810's for $30, 65XE's for $50. Most of the hardware as I understand,
he used the 810 as an example, do not come with cables..but he would
throw them in for about $8. I don't know if this applies to the
computers. Paul, the guy I talked with seemed to be the only one
with a clue and he was very busy and I am greatful he took time out
to talk with me.

They also have 2600's, 5200's, 7800's etc... Apple][and so forth..

also brand new Atari Graphics tablets for $25.

1 XEGS in box with everythig for $100, 1 XEGS minus boxes etc...and light
gun $85.

If anybody buys some stuff, please let us know!

David; I believe B & C still sells cartridge making supplies, but I think they charge more for the blank boards & cases then you can buy most carts for. If by connectors you mean 30 pin edge cards, just about any 30 pin will work. There's still about 2 suppliers I know of in sili con valley that still have boxes of them.
Rick

3661. Re: Reference for programming joystick ports

James King (jeking7@delphi.com) wrote:
: Still considering my security project, but havent found any decent
: references to programming the joystick ports (which would probably be
: the only decent (easy) input/output ports to use).
~~~~~~~~~~~~

PORTA $D300 D7 D6 D5 D4 D3 D2 D1 D0
(Stick 1) (Stick 0)

PACTL $D302 D7 D6 D5 D4 D3 D2 D1 D0

D2 = 0 Enable direction control register at PORTA
D2 = 1 Enable I/O PORT at PORTA

PORTB $D301 D7 D6 D5 D4 D3 D2 D1 D0 (800/400 Only)
(Stick 3) (Stick 2)

PBCTL $D303 D7 D6 D5 D4 D3 D2 D1 D0 (800/400 Only)

D2 = 0 Enable direction control register at PORTB
D2 = 1 Enable I/O PORT at PORTB

PORTA can be changed into the PORTA direction control register by
clearing bit 2 in PACTL. You can then write a value to PORTA that
sets up which bits are input (set bit to 0) and which are output
(set bit to 1).

Before data can be read/written to the port, bit 2 in PACTL needs
to be set back to 1.

e.g. Set up D0-D3 as input and D4-D7 as output.

LDA PACTL
AND #$FD ; Enable PORTA DCR (Clear D2)
STA PACTL

LDA #$F0 ; D0-D3 are input lines and D4-D7 output lines
STA PORTA

LDA PACTL
ORA #$02 ; Enable PORTA I/O PORT (Set D2)
STA PACTL

LDA PORTA ; Read from Stick 0 (D0-D3)
ASL A
ASL A
ASL A
ASL A
```

```
STA PORTA ; Write value to Stick 1 (D4-D7)
```

If you have a 800 or 400 PORTB and PBCTL can be used in a similar way.

Not used my 800 for years since both my 1050s broke :(several times :((
so I couldn't check the above program.

Hope this helps.

>covered by using TRASH-80 copier.

There was no need for a "TRASH-80" flame. Grow up. Has it occurred to
you I actually know what I'm talking about? And that I even have copies
of the Western Digital FDC data sheets?

>Things like this would require a combination of a Happy Drive, Copy II
>PC Option Board and other hardware.

None of those are going to let you copy laser holes, or even "weak bits".
And I can just use full-height drives and turn the speed screw if I need
to write a "slow" track. It might be a good idea, though, to update the
tach software I have for a larger speed range so I can adjust to an
accurate slow speed.

>There are simple hardware modifications including a switch that would
>change the drive speed. Writing with a slower than average drive
>speed would cause the sector read back by a normal drive to CRC error
>out. This method again is quite crude as the error wasn't truly
>reproducable -- sometimes you'd have to attempt this a few times to
>get a legit copy.

Even easier is to omit the F7 byte in the Write Track data, which is
the code used to put the correct CRC on the disk in the first place.

>>3. The disk has two sectors that both claim to be the same sector, so
>>the program re-reads the sector until it happens to get the other
>>copy. [I think this was quite rarely used.]
>This was done quite a few times. This method required using a more
>advanced hardware copier CHIP,

Not really. You can give the FDC whatever value you want for side, track,
and sector numbers, as long as they're in the range of 0-244. (F5-FF are
used to deposit address marks and such on the disk.) This is how skew is
done in the first place. Heck, even the various TRS-80 DOSes couldn't
agree whether sectors should be numbered from 0-17 or from 1-18.

If you issue a Read Track command and analyze the data, you could even
read identically numbered sectors on one pass.

>this was placing more sectors per track (up to 27+) with usually
>smaller than 128bytes/sector to fit them all. This (beyond about

Small sectors? No problem. I'd be talking to the FDC directly anyhow. Synchronizing tracks might be a bit of a problem, but I can just add extra gap bytes if I need to. It's only really a problem on the Apple II, which ignores the index hole completely.

>22-23 sectors/track) was difficult (impossible) to reproduce with the >Happy Drive as it was not a bit copier. Some people tried slowing the

Too bad you have to have an extra CPU in between you and the FDC chip. There are a lot cool of things you can do by abusing the 17xx chip, just like with abusing 2600's TIA chip.

At least a few TRS-80 disks even had both single and double density sectors on track zero for "dual boot" on both the Model I and III by switching density in the middle of formatting the track.

3666. Horrible XE crashes! :(

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-27 00:00:00 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <D7pLHu.8y4@itex.jct.ac.il>
Source record: 92157

I'm just doing anything - Joust or DOS or Ice-T or whatever - and suddenly, out of nowhere, my RAM gets messed up (but not the Ramdisk) and the computer crashes. If I'm lucky enough to have the display list stay complete, I can see the screen memory getting messed up continuously, very quickly, in some pattern: 3-4 consecutive bytes, in increments of 8 bytes (like this: **** **** **** - * means changing, space means not) constantly changing. Another problem I have is that often the screen flickers and the color pot setting fluctuates, without crashing, but sometimes it's a sign of an impending crash. Anyway, I opened the thing up and poked around and I got nothing (no instruments used, just checking for loose connections). After such a crash, rebooting may or may not cure the problem. Sometimes even turning the computer off and on doesn't help - the Gr.0 screen comes up and quickly gets filled with junk, or doesn't come up at all.

Can anyone tell me what's wrong???!? This 130-XE cost me $300 and Jeff McWilliams about $50 and lots of time! It's loaded with upgrades (Newell 1-meg, US+ ROM, supervideo/audio, TT-touch keyboard) and I'd really be pissed to see it go to the U.S. for repairs... (more messing w/customs, months of shipping, hoping it won't break in the mail etc)

Thanks in advance for any advice! I'm using an 8088 right now :(:(:(

I'm not sure how PCXformer could affect the running of M65, but usually
you can use G nnnn command in DDT, where G is the command to run the program,
and
nnnn is a starting address. That's all that should be needed to get it up
and going. I think the version of M65 you have probably
didn't come with DDT. I believe that the M65 cartridge was the only one
to have DDT.

: They say they have about 400-500 pieces of software.

: Wants me to call back in 30 Minutes.

Heh! I have tried to convince Rennie (the owner of the Games + stores)
to do mail-order, but he was against it. Chandler? I thought the
Atari stuff was at the Mesa store. Anyways, they might be interested in
doing it now just to get rid of all thje excess stuff. I will talk to
Paul (on eof their managers) about it. Maybe they could advertise here
and in our newsletter.

The prices for stuff at the Games + store are comparable to other
outlets, but the 8-bit users here in Phx are used to dirt-cheap. That
would explain why they have so much. They used to charge way too much in
the past.

Neat idea. My only caution would be that you should be sure to set the
Followups-To: line, so that any responses come here and only here. And
you might want to add some general groups (comp.lang.c, for instance)
to the list.

The Atari 8-bit Omnibus is still available, now with a money back guarantee.
This ad-stravaganza filled with products for the Classic Atari costs only
$5 per copy. That includes worldwide shipping.

The Guarantee:
==============
If you don't like it/find it boring/think it's not worth $5/etc.,
just send me a letter with your name and address, saying what you
don't like. KEEP the magazine! I'll write back, apologizing and
including a cheque for your $5. Good enough?

Current Notes called it "...a nice piece of work...a neat idea..."

Comments on comp.sys.atari.8bit have included "Check it out!" and "Shell out
five bucks and get a copy of the Omnibus." Who am I to disagree?

So c'mon and try it!

I have the same printer. It's Epson emulation is not the same as
the old Epson MX-80 resolution. You're probably getting stretched-out
dumps, right? Try switching it into IBM Proprinter emulation. It's
actually a better fit for the "old" Epson graphics dumps. You can switch
by a coupla ways, I don't have my printer manual handy...

I have a boxed XEGS for sale. It is in MINT condition with all manuals, cables, etc. Included in the box are the matching controller, light gun, BUg Hunt, and Flight Simulator 2. The box is a little worn, but the system is even wrapped in the original plastic. The following carts are also included...

Boxed (complete): Super Breakout, Alien Ambush, Cloudburst, Eastern Front, River Rescue, KIckback, Soccer, ML Hockey

Loose (*w/ instructions): S St Letter Go Round, S St Big Birds Funhouse, Kaboom*, River Raid*, Megamania*, Choplifter, QBert, Popeye*, Frogger, Wizard of Wor*, Gorf*, KRazy Shoot Out*, Jumbo Jet Pilot*, Sub Commander*, Star Raiders*, Defender*, Caverns of Mars*, Basic (w/book), Galaxian*, Asteroids*, Centipede*, Computer Chess*, Music Composer*, Space Invaders*, Basketball*, Qix, Dig Dug*, Pac-Man, Pole Position*, RS Football (w/plybk)

Also included: Various bound cassette programs (Speed Reading, Edufun, etc)

Everything is in excellent shape, very clean, and well cared for.

If I get many offers, I will post an update. I will also consider a combination of cash and or Vetrex stuff. Thanx

>a think last night.

EOAs copy protection on some of their earlier games (e.g., Archon, MULE, Hard Hat Mack) were very temperamental. They required precise placement of the sectors on track $02. Earlier versions of HBP had a problem making reliable copies every time of them. Are you using a backup or the legit copy? Besides that the loader would coldstart (jmp $e477) the first read in and self-modify itself by XORing the data bytes. Nasty stuff.

You probably need to get a new copy or you may have a newer ROM which the EOA CP may think in an "illegal ROM at $c000" or the BASIC cart may be built-in and need to be disabled with an OPTION key at boot.

Lates!

3682. Adresses $D600 - $D7FF: what they're for ?

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-28 00:00:00 UTC
From: madaras@kosice.upjs.sk
Message-ID: <3npu9p$eea@sun.uakom.sk>
Source record: 92173

As for bad status of our news-servers and falling of them I lost my
previous article with question on this topic, so I'll repeat it here:
In all available documentation I have, I could find only this:

$D600 - $D6FF ... not used yet
$D700 - $D7FF ... Atari reserves for purposes of tests

Does anybody know, for what are these adresses used nowaday, what
happens while reading/writing to this part of memory and if there are
some extensions, programs etc. which use these adresses?

Thanks for any info.

Tommy

Thanks. Do you have any addresses or fax numbers in case I can't get
them over here? I rang up a decent electronics suppliers last night
but the best they had were 34-pin.

...

and David Paterson also helped out.
> Try BEST Electronics - they carry a variety of cart cases for different
> boards. They've also got the cart connectors, though I'd guess that a
> decent electronics shop would have a similar part.

Okay. I'll have a look for BEST's fax number, if they have one and
hope that those who offer a fax-sending service down town don't
charge me an arm and a leg for sending it.

Sorry to see you're off until September. Looks like it's goodbye for
a while then :-(I'm losing my net account during the summer, but I
hope to be back (probably sometime next year).

Anyway, thanks again guys ...

Yes, he did blacklist me, but because I was telling the truth. I proved all the stuff that he said he was going to do he didnt have a clue (he is Jim Drew's equal). I wouldn't put much trust in him, he is a compulsive liar. I captured all the info that I got and he was using my programs I wrote and then selling them (I was pissed!). I had wrote a lot of nifty programs on the Atari 8-bit for Carina and he stole them, put his name on them and sold them, this is one reason I left the BBS world, the other reason is I stopped caring about the Atari 8-bit world after a switch to the PC in 1991 (I sold my BBS) with my new MIO and got out of the atari 8-bit totally in 1992. I do have the emulator though... :-)

I really am a nice guy, but I hate fakeness, I hate people when the lie to me and I cannot stand people that are so biased towards something they make up stuff to keep them going. Oh and I hate when people get attitudes with me, otherwise I am fine. Shadow did all of the above and more....

3691. Old game - anyone know it?

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-28 00:00:00 UTC
From: maury@softarc.com
Message-ID: <maury-2804951446560001@edwarda.interlog.com>
Source record: 92182

I'm researching an article on sapce adventure/arcade games. The best example of such a game is "Elite" on the C64.

From my memory of those days, I remember a game on the Atari 8-bits that actually came out at about the same tie, or perhaps earlier, that was very similar in concept. See if this description rings a bell...

You are a ship-owner on a planet that is a former Earth colony. In the past, Earth kept your colony "up to date" and supplied by sending you periodic shipments in the form of canisters filled with goodies. All contact with Earth was lost years ago, and no one knows why. Rumor has it that just recently another canister has appeared in space, but it has not yet been recovered.

Your "mission" is to build up your ship and go hunt down the canister. In fact, you don't have to if you don't want toy, you can do anything you want, including becoming a pirate. The real goal is to become rich and famous.

The game seemed quite a bit more complex than Elite, including orbital plotting etc. I remember reading a review in Analog (I think, I don't think it was Antic) about the game, and I wanted to buy it REALLY bad, but never did. I think it was called Imperium, Empire, something like that, although it was unrelated to the "classic" games of the same name.

Does this ring a bell for anyone? Did anyone play this game? If you know anything about this game, could you please drop me a note? This is not my account, my address is...

maury@softarc.com

Thanks!!!

Maury

If you have a Happy Drive, you need to put the drive in SLOW mode. Otherwise, it boots to fast, and the copy protection scheme kicks in. If you have the optional control switches for the Happy drive, set the switch to the slow position before you turn the drive on, and leave it in the slow position. If you don't have the optional control switches, run the Happy utilities first to set the drive to SLOW mode.

If you don't have a modified disk drive, make sure you boot without BASIC. You may also need to used a translator. Of course, these last two suggestions are obvious...

3693. ATARI 1040/ST >> MS-DOS

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-28 00:00:00 UTC
From: Greg Poulos <soundwsh@escape.com>
Message-ID: <3nroha$qvm@beyond.escape.com>
Source record: 92184

OK..heres my problem:

My friend has about 2000 pages of text written in WordWriter 2 on
a Atari 1040/ST and needs to transfer those docs into a newly bought
PC Clone.

Are there any conversion programs or ways to do this?? Is a serial link
a worthy thought?? I know all of the PC world and none of the Atari.

Thanx in advance,

gregO

I have a 320k XE that "used" to do the same thing. Ended up being a partially seated 40pin IC. Dont recall
the name offhand, but on an XE, it's upper right hand side as you're facing the board.

Yours is socketed, as that chip is modified (pins lifted) when the Newell 1meg upgrade is installed.

3695. Source for CX85 Keypad??

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-28 00:00:00 UTC
From: chris@world-one.com
Message-ID: <D7q8z3.L03@world-one.com>
Source record: 92186

Does anyone have the Basic or Assembly source for the keypad driver?

It's amazing how things like the CX85 can seem to materialize out of
thin air when you don't clean out the atic for more than 7 years. <G>

Thanks in advance,
Chris

Chris, I didn't read it all, but I do know how addition works in computers (and about the roll-over and stuff), and I'm curious.. using the ADC operation, can you easily do addition/subtraction of LARGER-THAN-TWO-BYTE values (and do it proportionally quickly... ie, just keep doing the same commands over and over for how many bytes you're using?)

And why the hell wasn't FP put in Action! !? <:^[

D >get the system to see the drive. I have tried all 4 switch settings on
D >the back of the drive (I think), but I get the same results. When I turn
D >on the drive, the activity light cycles on/off every few seconds.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

This happened to me once. I had just bought two 1050's (no cables, no p/s,
just the drives) for $40 ($20 each) maybe 5 years ago or more.

One of the drives had the busy light cycle on/off every couple a seconds and
you could hear the motor running (same cycle).

I had to replace on of the chips. If I remember correctly it was the 2793
(drive controller). But this "on/off" stuff means "(atleast) one of my chips
is bad". Since I had two drives I could swap chips, they are all socketed.
If you try it this way, remember that some 1050's seem to use a ROM while
others use an EPROM for the drive O.S. These can not be swapped.

Howdy James

I don't know 1200XL's, but there is a picture on the latest issue of ATARI CLASSICS. It might be a 1200XL on that cover. And it's keyboard seems to have 10 function keys across the top right and one function key to the far left.

Maybe Bob Woolley knows...

```

Hmm, check out Ben Poehland's "Color and the clock" article in the Dec. 1993 (vol.2, No.6) issue of ATARI CLASSICS. Ben had a 600XL with a black&white screen. Maybe that will help.

For back issue's you can contact Atari Classics (see Vendor/developer list aka the Atari 8bit FAQ). Some issues are sold out already. This might be one of them.

Well, it was really when the Tramiels took over and decided to run with
the ST and to never release the 1090XL and either hold back or hobble
everything that Warner Atari had waiting in the wings in 1984 for the
8-bit (XEP-80, XF-551, etc..).

Technically speaking the a "1200XL keybaord" could be from more than just 1200XLs, as it was used for the 1400 and 1450XL(D) series. Just one more reason those were the best Ataris (for those who have them). Just some trivia.

: I've got a few software titles which I haven't seen available
: commercially anywhere. One of my mortal fears is that either through
: my own carelessness or a 1050 run amok, some treasured game which is
: very hard to find these days will no longer function.

: As insidious as "doc-check" copy protection is, and as much of
: a pain in the rear some of it is to use ("Page 53, line 27, word 5..."),
: at least you can make backup copies of your software.

: I doubt that many of the software manufacturers who offer a
: replacement policy for a nominal price (usually $5 to $10) are
: doing this anymore. In other words, if some of this stuff fails,
: it's all over. You either learn to live without or you try to find
: another copy of it somewhere.

: I've dug up Ultima III recently (currently looking for the other
: Ultimas made for Atari, hint hint), and I have not seen this title
: available commercially anywhere. What do I do if the disk fails to
: boot in the future? With copy protection schemes as I know them, I
: can't make a backup for archival purposes. Also, I paid $29.95 for
: one game fairly recently, and I don't want to pay another $30 should
: it fail (if I can find it at all).

: (Actually, in the case of U3, I bought it used at B&C a couple
: of years ago, and the twit who owned it first used the *original*
: player master disk as his/her scenario disk. Sheesh.)

: Another issue, of course, is a desire to place copy-protected
: software on a hard drive. Have any of you done this? Are there
: tools which allow you to do this?

: This is a touchy subject, due to the P-word, but it *is* a real
: concern for many of us who want to keep enjoying our software long
: into the future. How have some of you out there learned to adapt to
: this limitation? Can the inability to duplicate program disks
: eventually lead to the death of some titles, as disks slowly wear
: out and stop booting?

: I hate to even bring this up...but I remember crunching a couple
: of game disks for the 8-bit back when you could easily find replacement
: software and when the software companies could replace disks for a few
: bucks. I haven't mangled a game disk in my 8-bit renaissance yet...
: but I know it's possible and that I may have no recourse when it
: happens.

: And I'm proud to say that I have *never* possessed a copy of
: commercial 8-bit software which wasn't legitimate. Just thought I'd
: throw that in as flame retardant.

What I meant to say was that I had the same fears and got the Super Archiver II sold by Computer Software Services. It worked for everything I had except the Syn-series of disks. It's quick and slick and I think it is still being sold. You install it on a 1050. It will also handle enhanced density disks like Atari Planetarium.

RK>to arm/disarm the system. My problem is that I cut off the "joystick"
RK>plug from the keypad about 8 years ago (when my Atari lived in my car!)
RK>and do not remember the mapping of the 9 wires back to the joystick
RK>port pins.

Have you done any of the programming for this project yet? I can help you
out with the hardware, if you help with the software. I'm interested
in exactly the same project - and was thinking about doing a security system
for the exterior of my house using an XEGS and the joystick ports -- but
since I have 4 CX85's, that would be an even better idea.

C >crisp legibility of the letters, theres nothing better.
C >
C >i dont even KNOW how you people use flicker term. <shudder>

The problem (one of them anyway) with ICEt is that it's limited to DOS 2.5
or MYDOS. Being a power user myself, I prefer to use SDX or SpartaDos to
boot my programs up.

In addition, since I have 800megs of HD space, why should I have to boot
a term program off of floppy to use it? VERY unfriendly!

As the subject asks, does anyone remember when Atari stopped production of their 8-bit computer line in the U.S.? I remembered it was in 1988 sometimes, but I can't remember which month. (I remember Antic died shortly afterwards).

Something for those trivially-inclined.

I talked to Paul, the store manager of the Games + store in Mesa, AZ, and he informed me that they will do mail-order, but there is no catalog as of yet. I'll try to get a price list of some of their excess stock and if I'm sucessful, I'll post it here in the future.

The owner used to run the whole shebang along with his family. Since they've grown, he has hired new(er) managers who are more agreeable to mail order. Will keep you all posted.

Well, for an update, Shadow claims his board is running on a 14.4 of some type but my Hayes Accura 14.4 will not connect no matter how I play with settings. For the record, I used to have a 14.4 pro! board in my area and I could dial in to him with the same exact settings I used for my internet provider, no such luck with Ace.

Of course, Shadow said he had all sorts of people with 28.8s and such dialing in and getting high speed connects. Bullshit. The only way I could get on was disabling everything on my modem until it was essentially a vanilla 2400 baud modem.

I also went into settings and saw all these translations supported like PETASCII and the rest. This is the much-fabled Carina 3.0 translation system which was supposed to break open the ASCII/ATASCII/ANSI wedge barrier but everything was just superficial, none of those menu items mean anything right now, and I vaguely recalled when I dialed in, must have been a YEAR ago when those changes first appeared. And it is still in the same state of limbo and I am surprised when the sysops go into the sysop base and ask Shadow "what's up with Carina 3" after waiting for 2-3 years.

Shadow claims to be able to do HS on his MIO by using the replacement R: handler for it to kick in hardware handshaking.

So that's the only thing that sounded plausible coming from his keyboard.

I'll probably call back 6 months from now to see if things change.

I'll be the first to bury the hatchet and jump on the bandwagon if he only delivers the goods. Better late than never. After all, FTE made a lot of promises and has yet to deliver on some of them, but I never got the idea FTE was sitting on its hands, he's a busy guy and has to shuffle priorities and projects.

Joel somebody -- no .signature, and Portal doesn't give me the message headers here in the editor -- writes:

>That reminds me... does anyone out there know what the overflow (V) flag is
>for in relation to ADC and SBC??? Something to do with signed multi-byte
>addition but that's all I have ever found out.

For what it's worth, here's MY understanding:

ADC and SBC are the _only_ "add" and "subtract" instructions on the 6502. We use these selfsame instructions for all kinds of arithmetic: signed and unsigned, single- and multi-byte. This works because the mechanics of binary addition and subtraction are identical in all cases: only our INTERPRETATION of the RESULTS differs between cases. I'll discuss addition in what follows, but the arguments are analogous for subtraction.

In all cases, the ADC instruction simply adds-and-carries bits, from the pre-existing carry flag/bit, to the least-significant bit of the calculation, then from least- through most-significant bit of the operands, then "out of" the most-significant bit of the calculation. The carry flag gets set if a carry "out of the most-significant bit" occurs, and the overflow flag gets set if a carry "out of the second-most-significant bit, into the most-significant bit" occurs.

In single-byte, unsigned addition, we first clear the Carry flag (using the CLC instruction) so that NO unwanted "carry into the least-significant bit" occurs. Then we perform the ADC as described above, and then we may wish to test the Carry flag to see whether a carry "out of the most-significant bit" occurred -- if it did, the result of the addition exceeded the maximum value (255 decimal) representible in a single byte, and our "result" represents only the least-significant eight bits of the "actual" result. If this concerns us, we may take some kind of corrective or error-reporting action.

We perform multi-byte addition, either signed or unsigned, as a series of single-byte additions, first clearing the Carry flag, again to prevent unwanted carry into the least-significant bit of the calculation. We then add each byte of the multi-byte operands, in sequence from least- to most-significant, being careful NOT to tamper with the Carry flag, which now "links together" our successive additions into one, by carrying the "ninth bit" out of one byte into the next for us. We ignore the Carry and Overflow flags -- for all bytes EXCEPT THE MOST SIGNIFICANT.

When we come to the most-significant byte of a multi-byte signed addition, or the ONLY byte of a single-byte signed addition, we become

concerned once again with the Carry flag as in single-byte unsigned addition -- we want to know if our result is too big to fit in the number of bits/bytes we're using -- but we also become, at last, interested in the Overflow flag. That's because, in such a byte addition, the most-significant bit ceases to be part of the numerical "value" of the byte, and becomes a separate piece of information called the "sign." ADC doesn't "know" this, and blindly allows carries INTO and OUT OF this bit "as usual." If NO carry occurs EITHER into or out of this bit, there's no problem: the bit has its proper value, indicating the proper sign of the result. If a carry occurs BOTH into AND out of the bit, the two effects cancel out (!) and again there's no problem. In both cases the Overflow flag is CLEARED. But if a carry occurs EITHER into OR out of the bit, but NOT BOTH, the bit's value in the result gets changed from its "correct" value, giving the result the WRONG SIGN. (Note that this is merely a matter of interpretation: the bit's value is RIGHT for an "unsigned" interpretation, and is only wrong if interpreted "signed.") And THIS is when the Overflow flag gets SET.

This has been a bit verbose, but I feel it's important to understand the context in which these things operate. Took me forever to make sense of the too-terse explanation of the Overflow flag in every 6502-programming book I ever saw, and I wish they'd given an in-depth explanation like mine here! :-) Your mileage may vary. In any case, I hope this helps.

Chris Chiesa

That is very untrue! It is not limited to just those two dos programs.
I am runing SDX and the very first beta of ICE-T. The only problem I
encountered with that is that I could not initially save my configuration,
but that only needs to be done once under MyDos/Dos2.5. I have also
played around with ICE-T 2.0 XE with SDX and it works perfectly fine for
me; this includes initial saving of configurations and everything else.
In short ICE-T does work with SDX.

14.5) What prominent Atarians are reachable by e-mail?

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari

engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

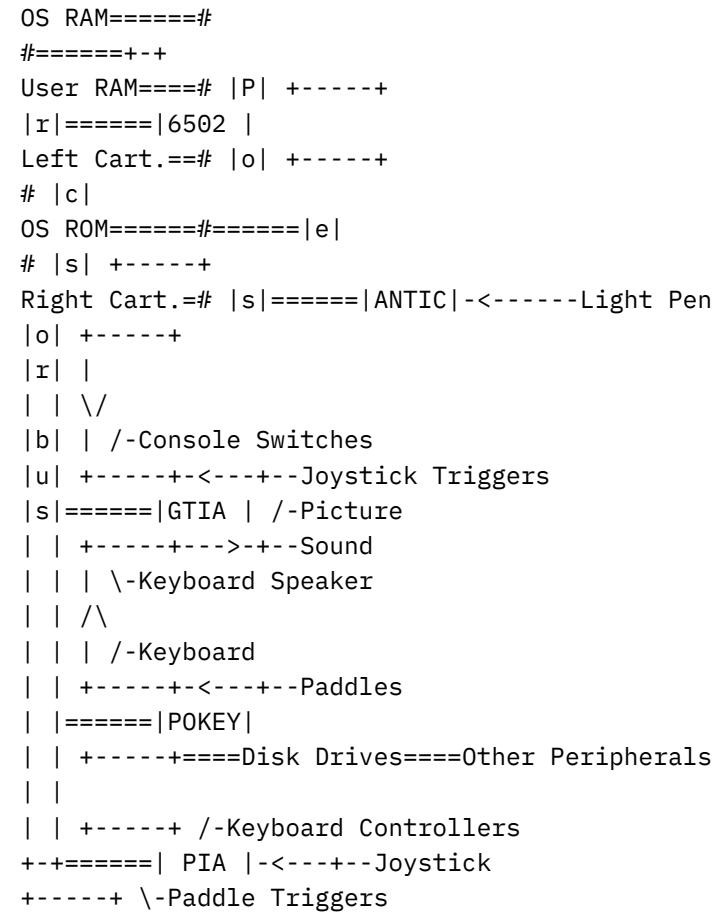
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE. According to mailto:masstorage@closer.brisnet.org.au (Masstorage), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO freddy) and an extra 8 RAM

chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill
Kendrick, mailto:kendrick@sonoma.edu, for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, character
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed,
the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,
and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text

3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through news:comp.sys.atari.8bit. This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

news:comp.sys.atari.8bit is archived by the INFO-A8 listserv.

Subject: 2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from mailto:lexicor@world.std.com

----

Subject: 2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements. The moderator may be contacted at mailto:emulators-request@qualcomm.com

----

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:atari8@netcom.com

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to mailto:atari8@netcom.com will NOT be cross-posted to news:comp.sys.atari.8bit. The Moderator is presently working to correct this.

The Info-Atari8 Digest is archived by the INFO-A8 listserv.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@vm.marist.edu, message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in the Info-Atari8 Digest.

Any postings sent to mailto:info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach news:comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST, or by sending a message to mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please note that this command must NOT be sent to INFO-A8@MARIST nor to mailto:info-a8@vm.marist.edu.

The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8:

You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST or by sending a message to mailto:listserv@vm.marist.edu that says "index info-a8". These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or by using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
mailto:ravi@mcnc.org (Ravi Subrahmanyan)
mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of this FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send e-mail to: mailto:atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu. Please name

the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

Subject: 3.6) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com
(Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing
the following single line. (What you put on the subject line doesn't
matter; blank is OK. This line should go in the text of the message.)
You will receive as a reply a simple page intended to help you learn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu; the Atari Archive as a whole is
maintained by Mickey Boyd, mailto:boydm@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
---
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)
d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, United States)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/atari/8bit
(141.211.128.22, United States)

g) ftp://phlem.ph.kcl.ac.uk/pub/Atari8bit (137.73.4.24, United Kingdom)

h) ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
(147.70.146.36, United States)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is
maintained by Adam Bryant, mailto:adb@albert.bu.edu. This site seems to
have seen no uploads for years, but there are some files here that aren't
on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen,
mailto:eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net.

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari 8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Closer To Home Archive?

Here is a fairly large FTP site in Australia kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer.brisnet.org.au/pub/archive1/8_bit (203.4.149.97)

Support site for James Bradford's Super 8-bit Products including SuperDos, SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer.brisnet.org.au/pub/incoming

Subject: 4.7) What is the James King Archive?

Here is a growing 8-bit Atari FTP site kept by mailto:jeking7@delphi.com (James King)

ftp://ftp.xmission.com/pub/users/j/jeking/8bit (198.60.22.3)

Uploads go in ftp://ftp.xmission.com/pub/users/j/jeking/uploads

---

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National Public Telecomputing Network. It can be accessed by any of the following: telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group C.A.I.N. - Central Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari Community E-Mail Directory" listing. Send correspondence and press releases to mailto:xx004@cleveland.freenet.edu.

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to
mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne at
mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a
BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.5) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by
mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as
http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be
regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100
terminal. Log in as www. Does not allow users to "go" to
arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on
your system if your administrator has not done so already. The
best plain-text browser, so move mountains if necessary to get
your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser
in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest
of the world. The line mode browser, plus extra features. Log
in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several
browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive through
Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I
personally recommend this method for downloading from the Merit/UMich
Archive.

There are also several mirror archive sites with Gopher servers:

gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit

gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit

gopher://gaia.ucs.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.
edu/atari/8bit

Subject: 7.1) What WWW pages support the 8-bit Atari?

Atari 8-Bit Computers FAQ and Vendor/Developer Lists, Michael Current
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq.html

Atari 8-Bit Home Page
mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper)
http://www.cs.vu.nl/~ipoorten/Atari.8bit.Homepage/index.html

Atari 8-Bit Resort
mailto:un55@rz.uni-karlsruhe.de, Marek Tomczyk
http://rzstud1.rz.uni-karlsruhe.de/~un55/8bit.html

Big Atari 8bit Home Page
Tomasz Tatar, mailto:tatar@student.uci.agh.edu.pl
http://www.uci.agh.edu.pl/student/airgrp/tatar/public_html/Atari/hp.html

Central Atari Information Network
Cleveland Free-Net Atari SIG, mailto:xx004@cleveland.freenet.edu
http://ace.cs.ohiou.edu/personal/mleair/cain.html

Rob Funk's pages
http://www.cis.ohio-state.edu/~funk/
mailto:

CompuCat BBS
mailto:nkinney@netcom.com, Neal Kinney
ftp://ftp.netcom.com/pub/nk/nkinney/html/compucat.html

Classic Computer and Video Game Systems
http://www.gate.net/~cmwagner/atari8.html

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

Downloading

Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading

Just cp the file into /afs/umich.edu/group/itd/archive/atari/8bit/New
[What is the propsero:// URL for this?]

Subject: 7.9) What is #Atari8?

There is a channel on Internet Relay Chat for 8-bit Atari users. Its name is #Atari8. Join #Atari8 on port 6667 (EFNet) and enjoy (if you meet somebody there).

There should be a small bot called XE_BOT on this channel. While on channel #Atari8 use the command
/msg XE_BOT help
for more information.

The latest information on #Atari8 and the XE_BOT may be found here:
http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/Atari/irc.html

Channel #Atari8 and the XE_BOT are the work of Tomasz Tatar,
mailto:tatar@student.uci.agh.edu.pl.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online magazine of the Cleveland Free-Net Atari SIG. The editor is Mark Leair of the Atari SIG. 8-bit computers support is provided by Michael Current and Craig Lisowski. For information, write to the Atari SIG at mailto:xx004@cleveland.freenet.edu.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of

UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

.xmo stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always (see companion Vendor/Developer List for complete contact info). A freeware 8-bit Atari emulator for the Atari ST.
Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer, from Branch Always (see companion Vendor/Developer List for complete contact info). The 8-bit Atari emulator for DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 is the commercial version.

The following further info on PC Xformer provided by Bill Kendrick, mailto:kendrick@sonoma.edu. Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU. It does not support ROM files, disk image swapping within the program, player/missile graphics collision detection, sound, PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800 or an Atari 800XL. It requires about the same as 2.0. It does support ROM files and the PC speaker is used to emulate the old Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800, 800XL, or 130XE (128K RAM; I heard it was to do 320K but I think that was reduced). It requires a 386 and 512K of memory. It supports Sound Blaster, player/missile graphics collision detection, modem/printer and PC joystick support. It comes with a disk with the software, an ammendum to the printed documents, and a bunch of Atari 8-bit software (example programs: demos/games, and a few useful utilities). It supports disk swapping through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference. It includes appendicies explaining graphics, sounds, colors, BASIC, subdirectory paths (for MSDOS which in turn explains SpartaDOS/MyDOS), a quick keyboard reference, ATASCII characters (all 128 drawn out), the Atari editor, error codes, file IO (commands, devices, XIO calls) as well as giving breif information on how to contact other Atari users, common file extenders, and it includes a LARGE glossary explaining Atari BASIC / TurboBASIC XL commands, Atari computer terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
Merit/UMich: Telecomm/ft80v037.arc

Ice-T 1.0 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: No
Backscroll buffer: yes (One screen)
Capture-to-disk: No
Summary: Excellent for high-speed VT100 emulation
Merit/UMich: Telecomm/icet.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
Merit/UMich: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
Merit/UMich: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu,
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you

can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. (Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25-pin
port.)

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go from
#1 on the right to #13 on the left on the 'long' side
and from #14 to #25 from right to left on the 'short'
side. #25 is closest to being under #13. A male
connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

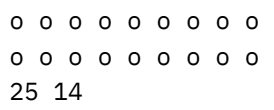
A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.



(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed but also pins 4 and 5 as well as 6 and 8. Or better yet, make a true 25 wire, straight through cable and use a commercial null modem. A commercial null modem is just a small device with the correct lines already crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

Major contributors to this section:

SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB

= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through

joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides

subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53/4 is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS 3.2)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)~same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col., print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder

XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have. I'm also not sure how much of this section is valid outside North America. If it's not valid where you are, I need to hear from you!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported

features such as intra-line editors. Unfortunately, the coding of the ABBCS was really poor. You could practically blow on your keyboard and crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the Atari 8-bit has been placed into the public domain or not. This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSes that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of the commercial BASIC XE cartridge to run. This BBS program was very popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This was a problem until very recently, when the disk-based version of SpartaDOS was re-released as shareware. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS, which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in Action! and only supports XMODEM Checksum transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE-- demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an

excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial programs. I haven't heard anything about OASIS IV and CARINA for a while, but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

1) See the "Atari 8-Bit Computers Vendors and Developers List." The latest version may be obtained in the following locations:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit news:comp.answers news:news.answers
mailto:mail-server@rtfm.mit.edu, message says:
send usenet/news.answers/atari-8-bit/vendev
quit

You can also ask me for a copy at mailto:mcurrent@carleton.edu

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, mailto:r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained by Lawrence Estep, AC's Telecommunications Editor, mailto:71450.1050@compuserve.com.

Subject: 14.3) Where is my nearest 8-bit Atari user group?

An 8-bit Atari user group listing is maintained by Atari Classics magazine's Exchange Editor, James King, mailto:jeking7@delphi.com.

Subject: 14.4) How do I use my new or emulated Atari?

"The Unofficial Atari 8bit Newbie / Stupid Question / Emulator Help FAQ" is maintained by Bill Kendrick, mailto:kendrick@sonoma.edu. You can write to Bill at New Breed Software, 59 Palm Lane, Novato, CA 94945.

Subject: 14.5) What prominent Atarians are reachable by e-mail?

The "Who's Who in the Atari Community E-Mail Directory" listing covers people involved in all of the Atari computing and gaming platforms. This file is maintained by Len Stys, SIG Manager of the Cleveland Free-Net Atari SIG. Write to the Atari SIG at mailto:xx004@cleveland.freenet.edu.

I've already voiced my displeasure about the last issue. There was absolutely NO MEAT whatsoever between those pages. Almost every article was filler that had no merit to the Atari 8bit community whatsoever.

I feel for Jim Hood, but if the magazine will continue like this, perhaps it should be given over to folks who may do better with it.

Personally, I prefer the hardware packed issues myself (the last issue only had one article referring to the IDE/1200xl/16bit mod which is really of no value to most 8bitters).

IMHO!

Sounds to me like 1 of 2 things has occurred to your 600xl.

1) Your DRAMS are too fast (faster than 120ns)

or

2) You have one bad DRAM in there somewhere and it's trashing memory.

Did you socket your DRAMS? If so, pull them out one at a time and
replace them.

Supposedly, the newest versions of programs should be available at the UMich archives (ftp: atari.archive.umich.edu / gopher: gopher.archive.umich.edu, under "Mich. Archives" ; from either of those, go to "atari", then to "8bit").

Of course, the authors of at least three of those (I'm not positive I know what P4 is.. and in case it is, then no, the author isn't) are here on comp.sys.atari.8bit, so you can request the latest versions of their programs directly from them..

Good luck!

When I sent for it in '93, it was just a single sheet of paper folded
into a brochure, so one envelope with a stamp should be fine. BTW, I
think they also have an electronic version available. Check the vendor list.

>readers? Have we reached a point where we are so desperate for ANY kind of
>8-bit mag that we'll accept whatever scraps are haphazardly thrown to us?

Since I have the dubious honor of enjoying several hobbies that
are nearly (in some cases completely) without current published support,
I was as sad as you were to see the quality of AC suffer in its new guise.
The first issue under the new leadership had a couple of articles I
enjoyed reading, but the current issue was a complete flop, IMHO.
I was shocked to see the cover of the current issue. Gads, it isn't
even a good photocopy!
I paid for a disk/magazine subscription to AC, expecting that
the quality of the material I would receive in exchange for tha money would
make my investment worthwhile.
Sadly, this doesn't appear to be the case. At least not from
the first two issues.
I want to support what Ben said. It is a terrible thing that
cancer has its hold on the current chief of AC. However, that does not
absolve the responsibility to the paying subscribers. If the owner of
the company I worked for became seriously ill, we would still be
required to fulfill our contracts. I expect no less from those I
deal with.
That said,what should be done? Should we write it off as a lost
cause? Should we urge that AC be transferred to another party who could
better fulfill the obligations? If so, who? Or, should we sit tight,
give Jim and his family a chance to get their lives together, and hope
for the best?

Source record: 92082

Thanks for the advice, Jim, but I'm pretty sure the problem isn't in the DRAMs. As to the speed, I was using the slowest 41256's I have-- 150nS. So I don't think the chips were too fast. 150nS has worked fine for me in RAMbo upgrades in 800XL's.

As to the possibility of a bad chip, I already addressed that. In this upgade you have to solder 2 stacks of 41256K DRAMs together, then solder the stacks into the locations where the 41416's used to be, so you can't pull them out & test them one by one. However, I did rebuild both stacks with fresh chips & re-test. Same screwy results. After so many cycles of soldering/desoldering, the motherboard in that area is now rather hairy, & won't withsatand another round of replacing the DRAMs. It isn't possible to use sockets for these DRAM stacks, due to wires you have to solder to other holes (this is one NASTY hack!).

sigh Guess it's time for me to put this poor mangled creature out of its misery?

- Ben Poehland

3744. Jan/Feb AC: Some Concerns

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-30 00:00:00 UTC

********************************************************************************

Jan/Feb AC in April

I just received the most recent issue of the New AC (April 26). The cover
date is Jan/Feb 1995. The Nov/Dec '94 issue was apparently skipped, &
obviously the Mar/Apr issue will <again> be late.

I guess by now it's common knowledge to Net people that Jim Hood is seriously
ill with cancer, which is why AC went six months without publishing. This is
a personal calamity for Jim, but from a subscriber's viewpoint I can't help
feeling that the new owners of AC aren't managing their obligations very well
with respect to Jim's illness. Going 6 months without even sending out a
postcard note of explanation to subscribers was, IMHO, rather irresponsible.

I wasn't terribly impressed with the first issue back in October, & I'm even
less impressed with the currrent issue. Am I the only person who noticed that
the Jan/Feb '95 AC contains an article which was originally published in the
Jan/Feb '93 issue???? It's Bob Hardy's "Keycode Getter". Republishing your
own material without reason (it's usually only done when the original article
was hideously mangled) is one of the Seven Deadly Sins of the publishing world.
I can't imagine why Bob Woolley did that. Especially considering that I got
hit with some embarrassing letters pointing out that the info in Bob Hardy's
article is readily available in several reference books (see the Letters
column in the April '93 AC, p.5). It's double anguish to see someone else
repeating your mistakes-- especially when there is no need for it.

The front cover of the Jan/Feb AC was lifted directly from a cover previously
used on an old issue of the SLCC Journal (newsletter of the San Leandro
Computer Club, of which Jim & Bob are members). It was decidedly a step down
from the cover on their first issue. The magazine seems to be acquiring the
flavor of the SLCC newsletter. The sassy humor may be fine for a newsletter,
but somehow feels inappropriate to an international publication.

I really have serious doubts as to the future of the mag. Cancer is an
extremely serious illness, & Jim Hood has been incapacitated for 6 months
& will likely remain so for some time. I admire Bob Woolley for supporting
his friend in a time of need (as indeed, I'm sure we all do), but at what
point will they recognize reality & either find a new publisher or give up
the mag? After all, there are 200-odd (?) subscribers who have paid for
subscriptions & are seeing little return on the investment. None of those
```

people has been offered a choice on whether they wish to continue their subscription under the present circumstances.

In the meantime the magazine is adrift: it has no focus, no direction. It's pretty obvious that articles are just being "dumped" onto the pages with little or no editing or thematic development. And without Jim at the helm, now even the graphics are suffering. Is this acceptable to most readers? Have we reached a point where we are so desperate for ANY kind of 8-bit mag that we'll accept whatever scraps are haphazardly thrown to us?

I hope people who read this will not think me heartless. It is certainly not my intention here to impugn a man who has had the misfortune to fall prey to serious illness. (My own mother is dying of cancer, more slowly & with more agony than her doctors predicted.) But personal misfortune does not absolve a person of their obligations, & the new owners of AC have an obligation to their paid subscribers, contributing authors, & advertisers- who are being poorly served. The quandary caused by Jim's illness, & by the subsequent failure of Jim & Bob to deal with it realistically, has been a source of considerable anguish & equivocation for me. I'm surprised so little has been said about it by other subscribers.

Maybe no one else cares?

Or is it that people feel too much guilt to discuss it openly?

Has everyone forgotten that it was this very newsgroup that spawned AC in the first place?

256K 600XL with Alzheimer's

A year or 2 ago I received a set of instructions off the Net from Jeff Popp describing how to install 256K RAM into a 600XL. Apparently this is the printed manual that accompanies a "kit" of sorts sold by Best Electronics. This upgrade is an adaptation of the 256K upgrade originally published by Claus Bucholz in BYTE magazine in 1985 & later revised in Current Notes in 1986. The ICD RAMbo card is an exact duplication of the revised circuit published in 1986 in CN.

Jeff's printed instructions are rather poorly written. There are whole chunks of circuitry that are dismissed with "Do the wiring in Figure 2", & other areas where you are told to solder a wire & then he just leaves you dangling. I worked my way thru all that, & handled the messy part by installing a highly modified RAMbo card into the 600XL to handle the bank switching logic. I'd say I devoted a good solid week to deciphering the instructions, modifying the RAMbo card, modifying the 600XL motherboard, & then troubleshooting the thing.

Fooey, it doesn't work!

I sent out 4 letters to various people requesting assistance but got nowhere. I'm hoping maybe somebody here on the Net has either already done this upgrade or can advise me where to look to cure the problems, based on the following information:

1.) I can format, read, & write files to the extra memory. The PSI RAMdisk formatter (from the AC software disk), correctly identifies the machine as containing 256K RAM. I programmed it to set aside 128K as XE memory & the other 128K as a D8: RAMdisk. So far, so good.

2.) When I boot up into the OS self-test routines & run them, they all run just fine (as if it were a 64K 800XL). With BASIC bypassed I get 48 green squares, & all the other tests run fine. I let the OS cycle thru the self-tests for several hours, the machine is stable. (According to Jeff Popp's instructions, if you get this far you've successfully completed the mod!)

3.) Some cartridges don't work properly. the AtariWriter ROMcart, for example, seems to run OK at first, but after awhile it starts sending characters to the wrong screen locations. The screen gradually gets trashed, then finally the system locks up.

4.) The following BASIC counting routine:

```
1 FOR I=1 TO 10000:?"<6 SPACES>";I:NEXT I
```

behaves weirdly. The first time you RUN it, it counts to around 2000 then bombs out, either with a spectacular crash or a bogus FOR/NEXT loop error message. Okay, if you do a RESET then RUN it again, it barely gets to 50 before it bombs out again. The error messages most often given are 13 or 15. But sometimes it just crashes in the middle of running, usually sprinkling the bottom line of the screen with some very interesting video trash & locking up the system.

5.) Dunno if this is important, but this machine has an 800XL OS ROM, & the ANTIC is the later version (CO21697). (This is the same machine I used for implementing the Super Video upgrade in the 600XL, so the video output is really nice-- including the screen crashes! It's also the same machine I described in "Color and the Clock" in the 12/93 AC.)

Well I'm not a programmer-type, so I'm mystified at how it is even possible that by adding 256K RAM I've managed to cause BASIC to lose track of simple things like FOR/NEXT loops. I feel a little guilty, as tho in the course of attempting to upgrade the machine's memory I've actually instead managed to give it a case of Alzheimer's disease <cringe!>.

I've gone over the wiring a zillion times & can find no errors. Either I've made some very subtle mistake or Jeff Popp's instructions contain an error which I have slavishly/faithfully reproduced. If anybody has any suggestions on where I should look for a hardware error that may be causing the troubles, I'd be grateful.

I hate to see this poor little machine crippled & suffering like this. If no one has any suggestions, I'll have to take it out in the back yard, say some soothing words, then aim the shotgun muzzle into the PBI port and.... ugh!

Anybody?

LIS 22

Item 1293189 95/04/30 00:52

From: B.POEHLAND Benjamin L. Poehland

To: COMP-SYS-ATARI-8BIT@CS.UTEXAS.EDU@INET#

Sub: PAL Burner for Sale

PAL Burner for Sale

I've decided to part with my PAL burner. It's brand new, still in the box, never used. I paid $270 for it last year from JDR. To my knowledge this is the cheapest (& rarest!) PAL burner on the market; I spent over a year sifting mags & catalogs before I bought this thing.

Sale price: $150.00 + shipping. USA buyers ONLY!

This is the Modular Circuit Technology PAL programmer, it's the exact same unit Bob Puff uses to burn all the PAL chips he uses in products from CSS.

You need an IBM/compatible for it (PC/XT/AT/whatever, it runs on anything).

The unit consists of an 8-bit card that plugs into the ISA bus. There is a little metal box with a ribbon cable that plugs into the card. On the metal box is a ZIF socket where you plug in the PAL chip you want to read/burn. The hardware setup is very much like a typical EPROM burner.

The unit is accompanied by a manual & a disk of utilities that allow you to read fuse maps from PALs whose security fuses are intact, or to burn PALs with fuse maps you've created or which already exist in a file somewhere. (There is no info on how to create fuse maps, you need CUPL or some such for that. Creating your own fuse map is more ethereal than M/L programming!) The manual is written in "Chinese English", which is understandable when you stop laughing (the grammatical errors are humorous).

Serious enquiries ONLY! (If you have to ask what a PAL chip is, you don't want it. This is REALLY hardcore tekkie stuff!)

- Ben Poehland
b.poehland@genie.geis.com

Note for the idly curious: a PAL chip has nothing to do with PAL video, (it stands for Programmable Array Logic). The Memory Management Unit chip (MMU) in all the XL/XE computers is a PAL. PAL chips typically run VERY warm (I'm not sure why). The "brain module" in the CSS XF551 Dual Upgrade contains two PALs, which is why that sucker gets so hot.

```
Yeah.. :) I know.. REAL.ACT.. it's NOT an elegant interface! <:^\

I'd like to see some operator overload support in Action! :)

Class String <- our type
Char Array <- (this syntax sucks) what it really is

Byte OpFunc Compare(String S1,S2) <- "=" in the comparison context
Byte O,A

If S1(0)=S2(0) Then <- sizes the same?
O=1
For A=1 To S1(0) Do
If S1(A)<>S2(A) Then O=0 Fi <- chars don't match .. not same
Od
Else
O=0 <- sizes not same ... not same
Fi
Return(O)
... <- other operators (add, subtract, assign (other "="), etc...)
EndClass

; Then we could do this:

...
String S,Password
...
InputString(S) <- hell, we could do I/O in the Class like C++ does w/ ">"
... (or whatever), instead of writing an "InputString" proc.

If S=Password ... <- and here we have our use of the "=" in the comparison
context, WITHIN a "String" context..

This is one of MANY things I'd love to see added to Action! :) :) :)
(Macros, better compiler directives, etc. are among the others..)

Oh, my point.. :) Oh yeah.. well, the same thing could be done for "Float"s..

"Float" would be a class, and all of the math operators we have for
Int/Byte/Card would be available for Floats... rather than running procedures
like:

Add(F3,F1,F2) ; instead it'd just be: F3=F1+F2 ... the executable'd be
; nearly the same, but the code would make more sense..

ill be quiet and stop dreaming :)

This does kinda suck, doesn't it? I never got around to resubscribing to
_AC_ way back in the BEGINNING (no spare cash) and was thinking lately of
subscribing to _Current_Notes_, but, now I've heard IT's going under..
and it looks like _AC_ is heading the same way..

That's kind of sad because I'd still like to write some printed articles..
(I always forget, there ARE others out there who aren't on Internet! :))

Hmmm...

What ELSE is out there? (Printed mags)

From: gkomatsu@uhunix3.uhcc.Hawaii.Edu
Message-ID: <D7unwz.I3o@news.hawaii.edu>
Source record: 92091
Cross-posted to: comp.sys.ti,comp.sys.cbm,comp.sys.tandy,comp.sys.atari.8bit,rec.games.video.classic

(sorry for all the crossposting...)

As much as I'd hate to let go of them (I've haven't even
had a chance to try and do anything "cool" with them yet. =^)
I must clear these out since I don't have the space to store
them. =^(
Send offers for each, will also consider trades for game
cartridges (I _can_ spare room for those, see list at bottom) or
I'll let this all go for a working Vectrex (I'll _gladly_ make
space for that, store it on the bed and sleep in the bathtub if
I have to. =^)

TI 99/4A cartridges:
Parsec both have the box and manual, while I can't test them
Car Wars I don't see why they wouldn't work, they appear to be
brand new. (if not old from sitting in a warehouse for
several years.)

Commodore plus/4
CPU and power supply. works fine.

Tandy Color Computer model 3
pair of tandy sticks (little black boxes with red button and free
floating joysticks)
TRS-80 "Deluxe" Joystick.
Facemaker cartridge with case & manual
Computer works fine, I haven't tested the joysticks (if
someone can pass me the BASIC command to read them I can)
Facemaker doesn't seem to work (maybe needs cleaning)

Atari 400 & power supply
Doesn't seem to work, though the power supply could be
the culprit.

Atari 8-bit power supply
fits my 800xl and I suppose other xl computers too, works fine.

-----

will trade for carts for these systems:
Atari 2600 5200 7800 XE/8-bit
Colecovision Intellivision Vectrex

3752. Power Supplies

Newsgroup: comp.sys.atari.8bit
Date: 1995-04-30 00:00:00 UTC
From: gkomatsu@uhunix3.uhcc.Hawaii.Edu
Message-ID: <D7uGwr.Bx0@news.hawaii.edu>
Source record: 92093

Does the 1050 (I think that's the number) disk drive and the
400 computer both use the same type of power supply?

Some time back at a thrift shop I picked up a 400, and
rummanging around a bit I found an Atari PS which seemed to fit
the power input on the 400. Took it home, didn't seem to work,
people suggest the power supply is the problem.

Recently visiting again, I ran into the 1050 drive (also
a casette drive, both I'm presently passing up since there's no
I/O cable) and nearby were a bunch of PS like the one I picked up
with the 400. Looking at the 1050, it appeared to have the same
power input, so I was wondering if they both (400 & 1050) use
the same thing, or different ones (and I'm using the wrong one
for my 400.)

Anyway, anyone want a 400 & power supply? (without any
major effort, I can't get it to work, maybe you'll have better
luck) I really don't need it...I have an 800xl (if anything, I
was only interested in the 4 controller ports and the joys of
typing on it's rock-keyboard. =^) Will trade for cartridges
and stuff...

Ahhh! I have a term paper due in my Computer Architecture class and I've
picked the good ol' Atari to write about.

NOW, here's what I'd like (and I of course need it soon - paper is due in
about 2 weeks or so <don't worry, most everyone else in that class is
starting about now as well :) >)

(1) Information on the 6502, PIA, POKEY, GTIA, etc. (ie, technical details)
(2) History of the above-mentioned chips (ie, "who, when, why, based on" etc)
(3) Suggestions on what else to say about anything

As for reference books, I've got:

Programming Atari BASIC A self Teaching Guide (for the XL's)
Antic's Anthology Vol. 1
De Re Atari
Mapping the Atari
Mapping the Atari XL/XE edition
SpartaDOS (disk-based) docs
SpartaDOS-X docs (on loan)
Action! docs
Quick docs
BASIC docs
A few of the first _Atari_Classics_ magazines
A random collection of old _Compute!_ magazines
A random collection of old _Family_Computing_ magazines
A random collection of old Commodore-64 magazines (name escapes me)

.. as you can see, I'm stretching the usefulness of some of the stuff towards
the bottom of my list, huh? :)

Anyway, any help, ASAP, would be appreciated!

(BTW, I DON'T know much about the 6502 and I DON'T know 6502 assembly langauge)

I haven't seen ANY of the new Atari Classics magazines, but I tell ya - if I was sick/dying with cancer (are they not in many cases one in the same), my life in jeopardy perhaps headed for peril... I really wouldn't give a rat's guess-what about the Atari magazine. I certainly don't mean to absolve anyone of thier responsibility, but I think if I was the one sick with cancer, I think I would put LIVING (or trying to LIVE) ahead of the magazine...or anything else...for what choice would you have? If I got well, then I'd FOR SURE accept the responsibility....is it an option otherwise?

Have you ever mail-ordered anything from a small company? What if the proprietor DIES after you send in your money but before the product gets to you? I suppose it's a chance you take that they'll live long enough to get the product out - assuming they're honest.

I suppose that this Jim Hood (don't know of him) didn't know that he was coming down with cancer (I have no idea how serious it is) and if he did, he wouldn't have accepted the responsibility. While I don't like sloppy magazines, I'd never hold it against someone who may be staring mortality in the face for dropping the ball on an 8-bit Atari magazine in 1995. I certainly hope he gets better, and the mag too, though.

James

Well, there's my page: http://zippy.sonoma.edu/~kendrick

In which there's:

some junk,
the "New Breed Software" pages, <- Atari related
and an "Other Pages" page, which contains links to:
quite a few Atari 8-bit pages,
a few Jaguar/Lynx related pages,
as well as other pages in general.

From the OTHER Atari pages, there are of course links to other Atari pages
(if that makes sense :)).

The links to my sub-pages are:

Other Pages page: http://zippy.sonoma.edu/~kendrick/other/other.html
NBS Home Page: http://zippy.sonoma.edu/~kendrick/nbs/nbs.html

In case you want links to them in your own pages or in a bookmarks file,
and simply avoid my personal home page.

1090XL - a peice of equipment which had card slots in it, like the expansion slots in an Apple IIe, IBM PC, etc. Things like card (vs. SIO/RS232-plug) based modems, expanded memory, etc. would have been possible with this gem. Complete vaporware, even compared to the 1400XL and 1450XLD, so far as I know! <:^(

XEP-80 - 80-column card. (Req. 2nd monitor or a switch-box thing.)
Not supported by too much; some terminal software and word processors.
Released officially - dunno when.

XF551 - Double-sided, double-density disk drive with high-speed mode I think.
After 1050's and upgraded 1050's this is the next most popular/standard drive. Released officially - dunno when.

Time for YOU to read the "Atari products" (not the real name :)) section of the _comp.sys.atari.8bit_FAQ_!

How about the pia? Are you able to swap that IC out?

If the machine works, but a few minutes later starts freaking out, it sounds like a chip may have been cooked in the soldering process. I've had a burnt pia do something slightly similiar to what you're explaining.

I'd *strongly* oppose anybody putting a 4mb upgrade in their machines. Not only are the drams stacked absurdly high (if you go the 256k route), but you have to remove the RF shield, then there's the overheating problem and finally you need a power supply that can handle the additional load (usually a PC power supply).

I've had a 1mb XE, but you need to be so very gentle with them - because they have a million hook-up wires all over the place.

The upgrades themselves are fairly easy to do -- but on an XE, you have to do a ton of desoldering.

From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <198C239BE@east-01.novell.leeds.ac.uk>
Source record: 92017

I have to say I disagree with the current thread of lets trash AC.
I quite enjoyed reading my copy, the range of articles was varied
with no particular issue taking up most of the pages. Surely the
magazine must try and appeal to as large a readership as possible
and that means article variety.

Every magazine thats ever been published has had its poor issues and
if you feel this AC is poor, then, well thats upto you, but surely
given the circumstances we must give the publishers a bit of leeway.
I never subscribed to the old AC, but I have seen several copies and I
remember reading pages of twaddle about buying and printing sticky
labels - now that was a great article - not!
If you don't like the present range of articles then might I suggest
you submit one of your own, I have submitted reviews of UK computer
shows where 8-bits have been well represented to both the old and
new ACs, sadly neither both articles haven't been published (yet?!)
but I live in hope.

Finally, give them a chance, if it hasn't improved when your
subscription comes up for renewal then let your money do the talking.
There are other printed publications, Page 6 here in England still
publishes their New Atari User magazine albeit in an A5 format, why
not give them a try?

> : : instructions and the opcodes, but I'd like something a little
> : : more in depth, preferably with a few worked-out examples.
>
> : The Atari Assembler by Inman & Inman, from Reston Publishing.

My personal bibles for 6502 programming are "6502 Assembly Language Subroutines" by Lance Leventhal and Winthrop Saville, and "6502 Assembly Language Programming", also by Lance Leventhal. Especially useful in the "Subroutines" books is the section devoted to "extending" the instruction set... how to do 16-bit increments/ comparisons/addition, long branches, that sort of stuff.

FWIW, when it comes to Atari memory maps, I've found "The Master Memory Map" to be much more useful than "Mapping the Atari".

> Worst book I've ever seen for learning Assembly from, or as using
> as a reference (I've tried it as both).
>
> And I still don't know what the instruction BIT does.
> So there.

From "6502 Assembly Language Programming":

"BIT -- BIT TEST

This instuction logically ANDs the contents of the Accumulator with the contents of a selected memory location, sets the condition flags accordingly, but does not alter the contents of the Accumulator or memory byte.

We should note that BIT has a rather unusual effect on the status flags, since it sets the Z flag according to the result of the logical AND operation, but sets the S and V flags according to bits 7 and 6 of the contents of the memory location being tested; that is,

Z = 1 if A AND (M) = 0; Z = 0 if A AND (M) <> 0
S = bit 7 of (M)
V = bit 6 of (M)"

And yes, this was the first place I actually found BIT fully explained. It's a handy little command. Lets you use two bits of each byte as "status" bits.

3767. XE messing up

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-01 00:00:00 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <D7x2xL.2r0@itex.jct.ac.il>
Source record: 92019

My XE is all messed up! It seems like the sudden crashes have subsided for now.. but the strange video and hardware problems are still there..

My video switches constantly between two "modes" (with anywhere between a few seconds to a few minutes between each switch).

Mode 1: Normal colors and everything is fine, but the weird thing in this state is that once in a while Option gets pressed, and it's not me pressing it!! This seems to happen just after switching from 2 to 1. The third symptom is that while playing Joust, trying to pause the game with the space bar (or pressing any other key for no reason) restarts the game about 1/3 of the time. This specific symptom occurred long before any of the other bugs mentioned here, and I thought it was normal, until I noticed it doesn't occur on my 800. This is *not* an OS problem, it still occurs when flipping the switch to 400/800 OS.

Mode 2: Wrong colors. Gr.0 screen is purple, etc. Setting the color pot can fix this, but it soon goes back into Mode 1, making the fix useless. Also, colors are brighter and sound is louder, but RF interference is stronger. Weirditudes described previously are gone (ie space bar in Joust works ok).

Again, my compute constantly switches between these two states, neither of which I like.. What is going on in my computer??!? (130-XE with Newell 1-meg, US+, Supervideo, Superaudio installed, naked eye can't find anything wrong with installation or connections.)

Thanks in advance for anything!!

Source record: 92096

>And I still don't know what the instruction BIT does.
>So there.

From Programing the 6502 by Rodnay Zaks

Description:
The logical AND of the Accumulator and Memory location is preformed, but not stored. The result of the comparison is indicated by Z. Z = 1 if the comparison fails, 0 otherwise. In addition, bits 6 & 7 of the memory data are transferred into V and N of the status register. It does not modify the contents of A....

Likely that really doesn't help much, but I've noticed that Mike G. (of SpartaDOS fame) tended to use the bit instruction a lot...

I've been seriously considering getting a 1-4MB upgrade on my 8-bit, but
I'm beginning to get a bit nervous! Itay Chamiel and Ben Poehland are
as of late both having trouble with RAM upgrades (Ben's with 256K in a 600XL,
Itay with 4MB (I think) in a 130XE) and I'm wondering exactly HOW stable
such upgrades are!?

If I were to go 4MB on my 800XL, would I never need to worry about it again?
(Or, a better question to pose, what are the CHANCES that I'd have problems
in the future (either near or far future)?)

Thanks for any comments any of you can give me (either "I've had 4MB in my
Xx for X years and it's worked XX% of the time without any problems!" or
"I've had X 1+MB Xx's die on me in a row!")

Source record: 92022

The mortal William Kendrick wrote:
Re: 1090XL

Bob Puff has one. There are 2 revisions. Revision 2 has what some
people say is an ISA-compatible bus.

The Black Box duplicates most of what a 1090XL does, and therefore those
that have 1090XLs can't really use them as much more than doorstops.

There are probably about as many 1090XLs floating around as there are
1450XLDs. A few...

It's debatable wheter Atari actually finished development on it. They
kept on tweaking it until the last minute.

: XEP-80 - 80-column card. (Req. 2nd monitor or a switch-box thing.)
: Not supported by too much; some terminal software and word processors.
: Released officially - dunno when.

The story on this is that it was originally going to hook up to the PBI
but was changed to joystick port for the LCD of the 400/800 crowd
(grumble grumble) all this despite the fact that AtariWriter80 really
needed a 130XE anyway so why bother? If it had been on the PBI then it
would have had no speed restrictions. However, how well it would daisy
chain with the BB or MIO is a mystery. Unfortunately the MIO and BB take
up the bus and don't even like the 1400 series R: and V: PBI assignments.

: XF551 - Double-sided, double-density disk drive with high-speed mode I think.
: After 1050's and upgraded 1050's this is the next most popular/standard
: drive. Released officially - dunno when.

The story here is that it was originally going to be a 720K 3.5" mech but
commercial program developers rejected that, so Atari buckled under. As
it stands, no commercial sw outside of perhaps PRO! has been released in
anything more exotic than enhanced density flippies.

Sad considering the fact that C= had the balls to release an official
3.5" drive for the 64.

>
>Nothing there is dependent on two bytes. As far as I can tell, you
>could cascade as much as you want.

Look at this:

```
CLC
LDA a1
ADC b1
STA a1

LDA a2
ADC b2
STA a2

LDA a3
ADC b3
STA a3
```

This is supposed to add the 3-byte integer b1,b2,b3 to a1,a2,a3.
Suppose a1+b1>255. Then the carry flag is set after the first addition.

Then suppose a2+b2<255... is the carry flag then reset to zero after the second addition? Or does it just stay set because the ADC does not result in a carry and hence the flag is unaffected?

Could someone clarify this?

- Joel G.

I have, somewhere, a copy of the SLCC article detailing the intallation of a 256k SIMM. Not being a hardware type myself, I don't know what would be involved in taking it to 1MEg. I have heard of an upgrade that adds 1024k in 2x 1024kbit x 4 DRAMs, giving an 800xl 1088k. I think it was from Germany - I may be wrong, though.

3787. AC Bashing

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-02 00:00:00 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2FA63956@POST0.LAAFB.AF.MIL>
Source record: 92028

It looks like csa8 is getting ready to start another round of whining and complaining at the instigation of Ben Poehland. I'm personally bored with all the negativism.

It really isn't clear to me as to what the objective is. If the objective is to get the AC people to change their ways, then I suggest the proper and more effective method is to talk directly to them. Generating a bunch of critical posts here isn't going to do one thing except cause more animosity and put Bob Woolley and Jim Hood on the defensive. (Or at least give them a chuckle. Maybe Jim and Bob have secret plans to make millions off our subscriptions and skip the country.)

How many of you have actually personally spoken to Jim and Bob lately? Ben Poehland sent them two post cards, according to Jim Hood. That's real effective. How many have volunteered to help out? How many have written quality articles? The 8-bit world has become a "self-help" environment, as you all know. If you want something done, you are going to have to do it yourself. I've worked on Current Notes for three years for free as an example.

Alienating the sponsors of the last US all 8-bit magazine is certainly a strange tactic to say the least. Any "misconduct" on the part of Jim or Bob ought to be addressed directly to them. Dragging the rest of the csa8 bandwidth into this accomplishes nothing. In fact, it scares off and intimidates any other person who might try to do something similar, like resurrect an all 8-bit magazine.

Ben, if you have any comments about my post, address them directly to me on email. I'm sure you won't do that, since you seem to enjoy public spectacle. But at least I'll make the attempt resolve this off-line without tieing up everyone else's time and energy.

I don't plan on saying any more on this topic in csa8. It's a total waste. If anyone wants a response from me, send email and I'll respond.

With that, "Let the personal attacks on me begin!!"

Ach! FAQ question, man! :)

ftp: atari.archive.umich.edu (hard to get in to)
amiga.archive.umich.edu (acts weird, sometimes down (like lately))
msdos. " " " " " " " " (hard)
mac. " " " " " " " " "
apple2." " " " " " " " "

gopher: gopher.archive.umich.edu (easy to get into, no uploads though)
(also be careful about binary vs. text
downloading of binary files!)

From FTP, cd to: "atari/8bit" ("/Games" for the games...)

From Gopher, go to: "Merit Archives", "Atari Archives", "8bit" (, "Games")

While you're there, get a copy of Cooltris and Sludge! :)

In article <3o4299$4f1@nic-nac.CSU.net>, kendrick@zippy.sonoma.edu (William Kendrick) says:
>
>How many Atari 8-bitter's are up here in the Northern Bay Area?
>(Marin, Sonoma, and surrounding counties)
>
>Would you folks like to start a small computer club? A newsletter? Something?

I suppose I'm on the periphery of being "in the area" (I'm in San Jose), but I have been wondering about a local user group since I rediscovered the 8-bit three months ago. I've thought it would be cool to have such a local group to discuss hardware and software, to trade stories, to buy, sell and trade equipment.

In particular, I'd love to learn more about the 8-bit "under the hood;" I'm rather hardware-illiterate and I'd love to learn more about upgrading, hacking and troubleshooting the hardware.

I'd be particularly interested in seeing hardware hacks and "special equipment" at work. I'd also like to learn more about diagnosis and repair of sick equipment (like my stupid, flaky 400) from people who have done that stuff before.

I don't know that be able to make that 4-hour round trip very often, but I'd certainly be interested in knowing about any events that such a group might hold...I'd certainly be interested in a swap meet-type event once in a while as well as knowing about significant events in the 8-bit community around here.

Well, that's probably true - however, my suspicions are that AC is somewhat of a "backyard" operation - most likely centered around the efforts of an individual - was it not Ben Poehland that busted ass (in large measure) to get the original AC out? He did an excellent job, no doubt... However, if he was out with cancer during the time he was at the helm, I wouldn't be too upset with him either.

I am just surpised that people act like this is a Ziff-Davis major computer publication with loads of assistant editors and a multi-million $$$ staff and corporation behind it. I seriously doubt this is the case with AC. If I saw the most recent AC, I'm sure I would share the criticisms of those who have voiced them here - but I'd be pretty understanding of them. I agree that $30 is pretty steep too.... I wonder if it's in the cards at all to have an Atari-8 magazine in this day and age.

If you've got a disk drive, get ahold of TurboBASIC XL.. the #2 in standards nowadays (#1 is of course plain vanilla Atari BASIC.) It's PD (except in Germany, unless that's changed!?!?) and comes with a Compiler and Runtime package!

Or, get BASIC XL or BASIC XE (on cartridge) which are also way up there - far better than plain BASIC.. the reason they aren't as "standard" as TBXL and Atari BASIC is TBXL can be gotten relatively easily and cheaply, and Atari BASIC came with all but 3 (released) models of the Atari... BXL and BXE need to be purchased (obviously)

Where? Well, used, from a vendor, flea-market, whatever...

Another KILLER Atari language (beats the PANTS of Atari C, any Atari BASIC, etc.) is Action!... if you can get it! (Costs $50... it's a cart. I've seen it for sale here on c.s.a.8 for $15, and once as low as TWO DOLLARS!) (I'm lucky..I got mine free from Bob Woolley if I promised to make useful stuff in it.. I hope games count as useful! :))

I'm pretty sure the cases are some form of plastic. Regard the FCC, I
know the original Apple didn't make FCC certification with the power
supply, so Jobs decided to sell it without the power supply. It was
something the user had to buy and install, this way he didn't have to
get FCC certification, but I think this was only on the first Apple.

Wow, I never heard of it. It would seem it would have to be fairly old though, because the 130 and 65's were no longer XL's!

Ahhh, you know, now I remember it! Someone wrote into Antic saying they had one and what could I do with it - answer - use it as a doorstop.

Another one for the books, remeber AtariLab?!

> The story on this is that it was originally going to hook up to the PBI

PBI? BB? MIO?

I remember reading about the Atari serial port way back when and being blown away by how good it was for it's time. A daisy chainable serial port!

Yup. Got it a while back. As I recall, it came on several disks. It
was fun, but a bit buggy - there was very little in the way of
error-checking, so if you accidentally left the drive open then it
would crash. It also seems to have been written in compiled Atari
Basic!!

Never quite figured out how to pay off the loan, though (the one
needed to buy your ship in the game, not the one needed to buy the
game itself - it cost 90 pounds on import over here).

Its kind of a broad, yet odd question. I have 800meg on my Atari - in the form of several MFM
drives tied into an Adaptec 4000a (to convert to SCSI signal) and finally into an MIO.

I like having that much storage as I can collect tons tons of software.

Unfortunately, no...

What >I< would've done (and what I WILL do whenever I make a huge multi-disk game) is this:

Insert disk B

Now, if you unARCed the files onto your HD, then disk B is the same as disk A is the same as disk C.

If you are using double-density disks, disk B is the same as disk A.
Disk C and D are the same as well.

Now what you do is type in the drive number where the disk is and it will look to there for it's files...

Inotherwords, a 10-disk game could be >10< disks if you have SD
It could be 5 disks if you have DD
It could be all in the same place if you have a HD

>
>Do the 6502 designers know?
>
> - Joel G.

Back in zee old days, the first college class I took was Assembly language
for the PDP-11. To make a long story short:

Overflow is set when an arithmetic operation exceeds the *signed* integer
limits. Carry is set on *unsigned* operations.

If you're doing signed int. math, you look at overflow. Unsigned, you
look at carry.

For a 8-bit, the limit for carry is 0-FF (hex). For overflow, it's 80-7F
(dec: -128 thru 127).

If you're still confused, I post a longer (but clearer) note.

Rich K.

3816. PC Xformer 3.0 questions

Newsgroup: comp.sys.atari.8bit

From: khaley@nova.gmi.edu
Message-ID: <khaley.799514828@gmi.edu>
Source record: 91966

I'm thinking about getting PC Xformer 3.0, and I wanted to ask others out here who have it what they think about it. Is it good? How fast would it run under a 486DX-50?

Also, does it have sound support? I've heard nothing about it offering sound support. Does it have full support of P/M graphics and display lists?

Thanks.

/Kevin

3817. XL power supplies

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-03 00:00:00 UTC
From: heller@akh104.rh.psu.edu
Message-ID: <3o8j4r$o3p@hearst.cac.psu.edu>
Source record: 91967

Well, again, after ripping apart another 800/1050 power supply to find
out that bad solder connections and a blown fuse were the problem...
I again am looking for the "rarer" power packs made for the XL's.

There is an article in some old users group newsletter that
was pulled from an electronics mag in the early 80's about the
XL power supplies and what you SHOULD DO to make the work
properly before you even hook them up to the XL's. (i.e. Rather
poor designs in the packs)

Anyways, I know of 4 types for the XL's... anybody care to match
up these descriptions with their part numbers?

Type 1) The Brick: Filled with epoxy. Black, HEAVY, Long and
slanted edges.
Type 2) The most common Black pack with vents along the top edge?
with a sliver label on top with power specs.
Type 3) Styled to match XL's long thin power pack. Top is white
bottom is black. Vents around top (?) but, they are grooved
just like the XL cases.
Type 4) Same as 3, but black tope as well.

(There are a lot of electrical differences between them all, maybe
Atari Classics should re-run this article from that electronics mag)

I am looking to trade (#2's) for or purchase type 3 and 4 supplies simply
because they look sexy and I don't feel my 10 XL's are complete
without at least 1 XL style pack.

I'm not aware of any XEGS video upgrade - especially considering that you
can only use a monitor/tv cable of using just the two RCA jacks. The AC
video hack is meant for split luma/chroma monitors/machines.

The OS ROM in the 600XL/800XL can be replaced directly with a 27128
EPROM, no modifications required. I have done this in the past.
Unfortunately I do not have access to the EPROM programming equipment
now, so I won't be able to help.

Don't forget to update the ROM checksums (one for the low part, one
for the high part), or disable the checking temporarily. Let me know
if you need details.

The Basic ROM should be directly replacable with a 2564 EPROM, but I
have not actually done this.
It can also be replaced with a 2764 EPROM, provided you add sockets for
the extra four pins and reroute two signals. On the 600XL (and I am
pretty sure the 800XL, too) the extra holes are on the circuit board,
and there are jumpers to take care of the two signals. I have done
this.

I have never seen the inside of an XE machine, so I don't know if this
is true there, too. (But since it uses the same OS ROM chip, that part
should work there, too).

PC Xformer 2.0 was fairly impressive. It does a much better job of
running Atari software than my copy of Xformer 3.0. 2.0 can at least
display the graphics, 3.0 just crashes!

I always have conflicting opinions about this sort of thing.

1. Criticism usually doesn't change anything and indulging in it almost always gives bad vibes all around. It is better to do something positive and hope you can make things better.

2. On the other hand, a complete lack of criticism seems to lead toward the "it's all we have so it must be good syndrome." Over in rec.games.video.classic people are fawning all over new, but weak, Atari 2600 games. I don't like the general lowering of standards that goes with smaller user bases

Hmmm. I haven't actually said anything about AC. Oh, well.

I don't have the books handy right now, but...
Since we know that ADC sets the carry if there is a carry out, I would
feel quite confident in assuming that it clears the carry if there is
NO carry out.

Weren't the old Apple cases metal? That would be the shielding.
Or, is it possible that they didn't bother with FCC class B
certification?

Only thing I can think of is to put it all in a metal case.

Or keep it far away from anything that might be affected by the
interference.

I downloaded and UU-decoded the FREE demo version that someone posted here. However, very early in the game, it asks for "side 2" to be insterted in my drive. Of course I cannot flip over a virtual disk - I had side "2" as drive "D2:" Is there a way to "switch drives" with PC Xformer, much as the Black Box and MIO could do? redirect drive numbers, that is....

3832. MAE 0.95 at umich!

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-03 00:00:00 UTC
From: d1dol@dtek.chalmers.se
Message-ID: <3o6jh1$ld6@nyheter.chalmers.se>
Source record: 92051

Hello everyone!
With permission from John Harris I put mae_95.arc at umich archives!
This is John's Macro Assembler/Editor v 0.95.
Below is a list of updates from previous versions.
Please do not distribute modified Archives!
For those of you that still are confused about what MAE is,
download and try it now!

Note! This is the 8-bit version, the 16-bit, twice as fast version is
included with Sweet16 by Fte.

WFR:
Fredrik Lundholm
d1dol@dtek.chalmers.se

PS. Any questions about MAE should probably be directed towards
John himself at: jharris@cup.portal.com DS.

--history.doc
- New since version .93 -

This will be the last version of the assembler that will run in 64K
of memory. Because the symbol table takes up half of the bank select
RAM area, there is just not enough room to fit the monitor into
banked RAM, or add the improvements I would like to do to the editor
and assembler modules. Thus, future versions will be using two banks
of XE bank select memory, and it will no longer be possible to make
do with a 64K machine.

When recording key macros in the editor, you must now use Ctrl-3 to
end recording, instead of Esc. This allows Esc menu commands to be
entered into macros, primarily to support a chain of assemble
commands when your program contains several modules. The next
version of the assembler should allow loading and saving macros to
disk, which will further enhance the macro usefulness.

Hunt routine in the monitor now automatically skips over the area
from $D000-$D7FF. So you can search the OS using $C000-$FFFF and
not generate any hardware accesses.

Hunt and Memory display routines would not always stop when the
address reached $FFFF. This has been fixed.

I removed the automatic OS routine detection from the trace function.
Now, you must use the S key to trace through OS functions in one
step, just like any other subroutine. You can also use the R key if
you are already within the OS code. The reason for doing this, is

that it makes things more consistant, and also allows you to trace code in the $C000-$FFFF area if you need to.

Pseudo-ops are now available in the debugger's single line assembler.

The debugger now includes a built-in function for switching between display lists for the debugging text screen, and your program's screen. It uses the letter "V", for change View. Both V and the "U" user function can be called from both the trace mode, as well as any paused memory or disassembly listing.
The "%" key did not work as a wildcard in the debugger, since it was interpretted as the start of a binary number. I have changed the default wildcard to "?" in both the debugger and editor. This propagated through a few of the debugger command key assignments, along with a few other changes as well. Overall, I feel the key assignments have been improved, and they won't be changed from now on. Here is a sumnmary of the changes:
? - Change Wildcard
= - Evaluate expression
V - Change display view
\ - Disk Directory

The editor uses the same wildcard configuration byte as the debugger. You can use the debugger's "?" command, or a Cntl-? in the editor to change the wildcard character. Both modules will use the new assignment.

1200XL function keys are now supported for moving the cursor.

You may enter Ctrl-key graphic symbols or international characters into the editor by pressing Ctrl-A, and then the key you wish to enter.

Now uses an improved method for detecting the default drive when first loaded. This should be compatible with all SpartaDOS versions, and cause no problems for non-Sparta DOSes. It also allows you to specify a different default drive from the command line, such as, "MAE D2:". If a drive is not specified, the default drive will be where the MAE program was loaded from. Note that this is slightly different from the previous behavior. If D1: is the current drive, and you type "D2:MAE", this version will set the default drive to D2:. The previous versions would set the default drive to D1:, being the drive Sparta was logged on to.

The MAE.COM file now comes with a RUNAD address installed. The SpartaDOS bug that prevented using the RUN command to return to a program which used RUNAD has been fixed in 3.2g and later, so I have decided to include RUNAD in the file now.

Fixed a stack corruption problem when disk I/O errors occurred during assembly with a .IN include file.

Improved documentation.

- New since version .92 -

The editor's label search using either the ^L or ^J commands has been made a bit cleaner. Searching for a label "TEST" used to stop if it found a label "TESTING", since "TEST" is a part of it. The search will now find the unique label. Also, the ^J JSR function will operate correctly on lines such as "LDA LABEL+1", and will take you to where "LABEL" is defined. Previously, things such as "+1" or ",X" used to confuse the editor about where the label name ended.

An example macro file is now included.

Note that version 1.0 of the asembler is going to use two banks of XE banked memory. I received some good suggestions that I want to implement, plus moving the monitor into banked memory will use up too much space in a single bank, leaving insufficient space for the symbol table. I hope this does not inconvenience anyone, but it is the best way to ensure the largest amount of main system RAM will be available to the user, without making any compromises.

- New since version .9 -

A long standing bug which could trash the Esc menu has been fixed.

The TAB compression could sometimes mess up .BY statements with ASCII strings.

The debugger is now ZP clean, so all of ZP is available for the user.

You can look at RAM under the OS, by setting the bit in $D301, as long as you are using SpartaDOS or some method of handling interrupts when the OS is disabled. Previously, this used to crash the debugger, which uses the E: OS routines for text output.

A faster version of the Hyper_E screen accelerator is included.

- New since version .8 -

Several intermediate versions were released, from .81 to .84. Depending upon which version you had, some or all of these changes may already have been in place.

Fixed problems in the startup code, that could cause crashes either starting the assembler, or returning to it from DOS.

The debugger crashed when giving an address in the I command.

The RTI instruction was not traced correctly in the debugger. This bug has been here for almost 10 years! I guess in all that time, I never had an occasion to trace through an RTI.

Fixed problems with extra CR's in the assembly listing. Note that the only way to send assembly listings to the printer right now, is by using I/O redirection through DOS, or you can use the 'O P:' command from the monitor.

I'll provide an option in the Esc Menu in the future.

The editor functions for label searching, and 'JSR', did not work when the source was entered in lower case.

Raw files loaded with the .BI command were not handled properly when assembling to disk.

Documentation for the SET directive was incorrect. The correct usage is:
SET label = expression

And every time the IDE locks up the computer it's reboot time. When you have
as many crashes as I've had lately, you get a little fed up with getting the
OS into ram, getting the IDE code in, going to DOS to try again....

Of course if I just did the whole thing right the first time....

Still having problemns reading the drive. Dang it, it worked for Bob!

Looking through Zaks' "Programming the 6502", page 60:

"If the two 8-bit numbers do not generate any carry, the value of the
carry bit will be zero. If the two numbers do generate a carry, then the
C bit will be equal to 1."

Hope it helps...

I have a 130XE that's in great shape, in the original box with the original instruction book. Includes power supply. I bought this a few years ago for $50 from someone who claimed to not have used it much. I have only hooked it up once. I also have an 800 and 800XL, so I'm getting rid of this machine.

Asking price: $40 + free shipping (and shipping will be significant).

So how's the game coming along? My brother played that thing and got
everything (the radiocomm messages, payed off the loan, explored over
half the planets, mined, assaulted, etc) but never finished it. He did
find that space anomaly, but didn't know what to do. Neither did I.

Yes the game was written in FORTH. I used a figFORTH disk to check out all
the radiocomm messages, the names of the products to sell and buy, the
mining conditions :). We figured out the best trading routes, the best
most profitable items to buy and sell, the best mining planets, etc.

The game was slow in places. The hyperspace was too monotonous. Setting
up the game took a lot of time. But it wasn't too hard, once you figured
out the ropes.

So, did anyone finish that game?

Rich K.

However it would be a problem to tweak-and-peek at the program. I don't
want to end up mailing my program everytime I want to see if I've fixed
a 50/60Hz problem. And I don't have the right hardware available which
would permit me to send a program over the Internet.

Maybe it is, as some people have suggested in follow-ups to this article, a problem with a chip that does not work when it has become warm. Normally when I suspect that I have encountered this type of problem in a computer or in a video game, I use a cheap and simple trouble-shooting method:

Take a piece of ice from the refridgerator, wrap it inside a tiny plastic bag, then cool one chip at a time. If cooling a particular chip seems to cure the problem in your system, you have probably found the faulty part.

You should be very careful with the ice though, do not let some water out on the circuit board. Also, you can buy cooling spray and use that for examining the hardware, but it is more expensive.

/Anders Skelander

Hmm? When I try to read a really long message (like the FAQ) in PabQwk,
I eventually get a line of garbage and when I try to keep going down, I end
up at the top of the message.

I have the following computer books for sale, most are for the Atari 8-Bit line of computers.

Title; Author; Publisher; Description; Price

6502 Assembly Language Subroutines; Lance A. Leventhal & Winthrop Saville; Osborne/McGraw Hill; Source & Reference for Assembly Language Routines;.....$5.00 U.S.

Advanced ATARI BASIC Tutorial; Robert A. Peck; Computer Direct;....$7.50 U.S.

An Invitation to Programming 2:; Atari; SoftWare Manual for Writing Programs; .....$5.00 U.S.

Atari 400/800 DiskGuide; John Taylor & David A. Wilson; Osborne/McGraw-Hill; .....$5.00 U.S.

The Atari Assembler; Don Inman & Kurt Inman; Reston Publishing; Reference for the Atari Assembler Cartridge; .....$3.00 U.S.

Atari Basic; Bob Albrecht, LeRoy Finkel & Jerald R. Brown; John Wiley & Son Basic Reference/Minus front Cover; .....$3.00 U.S.

Atari Basic; Bob Albrecht, LeRoy Finkel & Jerald R. Brown; John Wiley & Son Basic Reference;.....$5.00 U.S.

Atari Basic Reference Guide; Atari; Quick Reference for Atari Basic.; .....$7.50 U.S.

Atari Graphics and Arcade Game Design; Jeffrey Stanton with Dan Pinal; Arrays Inc.;.....$7.50 U.S.

Atari Microsoft Basic Instruction Manual; Atari; PhotoCopied and Bound

Manual;.....$5.00 U.S.

Atari Sound and Graphics; Herb Moore, Judy Lower, Bob Albrecht; Self Teaching Guide;.....$5.00 U.S.

Atari User's Guide; Mark Ellis, Robert Ellis & Larry Joel Goldstein; Brady Communicat Basic & Graphics for Atari 400/800/600XL/800XL/1200XL;.$10.00 U.S.

Basic Atari Basic; James S. Coan & Richard Kushner; Hayden Book Comp Atari Basic Book for the 400, 800 and the XL Computers;.....$5.00 U.S.

Beyond Games. Systems SoftWare for your 6502 Personal Computer; Ken Skier; Byte Publishing;.....$7.50 U.S.

Bits, Bytes and Buzzwords; Mark Garetz; dilithium Press; Understanding Small Business Computers;.....$5.00 U.S.

COMPUTE!'S FIRST BOOK OF ATARI GAMES; COMPUTE! Books; Type in Game Listings with info on Developing your own Games!;.....$5.00 U.S.

COMPUTE!'S FIRST BOOK OF ATARI GRAPHICS; COMPUTE! Books; Games, Tutorials, Programs & Other Helpful Information!;.....$7.50 U.S.

COMPUTE!'S SECOND BOOK OF ATARI GRAPHICS; COMPUTE! Books; Graphics, Utilities, Tutorials, Programs & Other Helpful Information!;.....$7.50 U.S.

Compute!'s First Book of Atari; Compute! Books;.....$5.00 U.S.

Compute!'s Second Book of Atari; Compute! Books;.....$5.00 U.S.

Compute!'s Third Book of Atari; Compute! Books; Games, utilities, tutorials, & other helpful info. XL Compatible.....$7.50 U.S.

Computers for Kids; Sally Greenwood Larsen; Creative Computing Press; ClassRoom proven manual that effectively and easily teaches

children to operate and Program the
Atari;.....$5.00 U.S.

The Creative Atari; Small, Small &
Blank; Creative Computing Press;
.....$5.00 U.S.

Disk Operating System II; Atari;
Reference Manual, 100 Pages;
.....$2.00 U.S.

DOS 3; Atari; An Introduction to DOS 3;
.....$3.00 U.S.

Games Atari's Play; Hal Glicksman &
Kent Simon; DataMost; Learn Programming
the fun enjoyable way... By Gaming!
With several Type in Listings;
.....$5.00 U.S.

Gemini-10X/15X Users Manual; Star
Micronics,; Manual for Gemini Printers;
.....$10.00 U.S.

The Home Accountant; Continental Soft
PhotoCopied and Bound Manual;
.....$1.00 U.S.

The Home Filing Manager Users Guide;
Atari; SoftWare Manual/Users Guide;
.....$5.00 U.S.

The Home Filing Manager Users Guide;
Atari; PhotoCopied and Bound Manual;
.....$3.00 U.S.

HomePak; Russ Wetmore; Batteries Includ
Manual for HomePak;.....$5.00 U.S.

Inside Atari Basic; Bill Carris; Reston
Publishin A Fast, Fun and Friendly
Approach to the BASIC Language!;
.....$5.00 U.S.

Inside Atari DOS; COMPUTE! Books; DOS
2.0S Reference.;.....$5.00 U.S.

Introduction to Computers and Data
Processing Shelly & Cashman; Anaheim
Publishi Class Room Text Book, not
necessarily about Atari Computers;
.....$3.00 U.S.

Machine Language for Beginners;
Richard Mansfield; COMPUTE! Books;
Personal Computer Machine Language
Programming for the Atari, VIC,
Apple, Commodore 64 and PET/CBM
Computers;.....$5.00 U.S.

Making it Count; Boeing Computer;
Student Manual/Introduction to
Computers & their Applications;
.....$3.00 U.S.

Mapping the Atari; Ian Chadwick;
COMPUTE! BOOKS; Comprehensive
sourcebook and memory guide for Atari
400/800;.....$5.00 U.S.

The Musical Atari; Hal Glicksman;
DataMost; Turn your Home Computer into
a Keyboard Organ;.....$7.50 U.S.

Music Construction Set; Will Harvey;
Electronic Arts; Just the Manual and
Reference Card;.....$5.00 U.S.

My First Alphabet; Atari; SoftWare
Reference;.....$3.00 U.S.

OS/A+; OSS; Manual for/Systems Software
for Apple and Atari Computers;
.....$5.00 U.S.

Paint; Alex Packer; Reston Publishing;
.....$5.00 U.S.

Program Design and Construction; David
A. Higgins; Prentice Hall In Book on
General Programming;.....$3.00 U.S.

Programmer's Reference Guide for the
Atari 400/800 Computers; David
Heiserman; SAMS; Good Reference;
.....$10.00 U.S.

User's Handbook to the 400/800
Computers; Jeffrey R. Weber & Stephen
J. Sczcecinski; Weber System's I Atari
Handbook;.....$5.00 U.S.

Your Atari Computer; Lon Poole with
Martin McNiff & Steven Cook;
Osborne/McGraw-H Guide to Atari 400/800
Personal Computers/includes XL Series
Update;.....$5.00 U.S.

[Deleted Text]

Along the same lines, what would be nice is a universal power supply
with enough watts to power the computer and all the periphirals. I
figure it would be a problem since the disk drives are AC and the
computers are DC.

I have an Analog somewhere in which Lee Brilliant has plans to construct
a UPS for the XL/XE computers, which in the process he builds a
replacement power supply. It would be nice to expand on this to produce
a power supply to run everything!! (I'm tired of running out of outlets
on my outlet strips!!!!)

: quickly get tired.

Are you using RF or composite? Sounds like RF. The XEGS has a composite video out and an audio out RCA like an NES 8-bit console. The composite is good (for composite) such that you should not be experiencing interference patterns on this signal.

For the sake of nonartifacted Gr.8/0 then split video (which the XEGS doesn't have) would be preferred.

This would be the hack to do. The XEs in general have the best stock video and you don't really HAVE to do supervideo on them. Their main problem is a somewhat washed out, bright display, but clean. SVideo I'm sure adds color saturation to XEs.

By the way, now is better than ever to consider a HD for the 8-bit. You can probably pick up a drive of 128 megs or so for $30-50 if you get the right type of 'forsaken' drive variety. These drives are cheaper than the going rate on used XF-551s with an exponentially greater storage capacity!

IDE drives are dirt cheap, about 33-40 cents a meg sometimes.

Old slow embedded SCSI 1 drives, especially full heights, are almost throwaways these days as people move to SCSI 2 and smaller physical dimensions. Drive speed doesn't matter that much on the A8. Not enough to worry about at least. Data rate is never going to max out like it is with clones. Drives with cache onboard do help some, kinda like a phantom MIO ramdisk...

I wouldn't even consider an MFM drive these days because then you have to deal with yet another variable in your hardware arsenal that can go wrong (Adaptec controller). A few years ago MFM drives had a big price advantage over SCSI. Now it's almost a waste not to simplify things and go SCSI. (I do realize that MIO users have the 256 byte limitation to worry about, though).

: C >
: C >i dont even KNOW how you people use flicker term. <shudder>

: The problem (one of them anyway) with ICEt is that it's limited to DOS 2.5
: or MYDOS. Being a power user myself, I prefer to use SDX or SpartaDos to
: boot my programs up.

I use TOPDOS PRO with nearly everything. ICEt works fine, as does Flickerterm (I am using Flick right now). I have a switch box to switch between my color monitor and an orange screen monochrome monitor for ICEt. If you don't use monochrome with ICEt, it's sorta tough to decipher but it's great with monomchrome. Flickerterm is much better for color monitors or TVs - a pretty decent 80 columns once you get the right colors and get used to the flicker.

I'm running 9600 baud on my modem and one problem with ICEt I've noticed is that with the new version, it will lock up in a short while just going through the newsgroup here. The old ICEt works better. This is when I am using my 850 interface. When I use a P:R: Connection, ICEt just doesn't work at 9600 baud - misses characters. Bobterm and Flickerterm, however, work fine with both the 850 and P:R:

: In addition, since I have 800megs of HD space, why should I have to boot
: a term program off of floppy to use it? VERY unfriendly!

My modus operandi is to leave my computer on all the time. I have a 320k 130XE and use a 256K ramdisk with all the term stuff loaded. With TOPDOS command files and menus I have constructed, I can quickly jump back and forth between term programs, editors, word processors, etc. and only rarely have to re-boot (usually to use a stand-alone program like Atari Planetarium). I do turn the system off if I'm going to be away for a day or more.

3862. Commodore monitor w/ 8bit question

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-04 00:00:00 UTC
From: khaley@nova.gmi.edu
Message-ID: <khaley.799604488@gmi.edu>
Source record: 91990

There is a Commodore 1702 monitor that I can get, and I was wondering if this will work with the 8bit Ataris.

Specifically, I have an Atari video cable with the following outputs:

Red, White, Black, and Yellow.

The 1702 has 3 inputs: audio (white), chroma (red), and lumina (yellow).

Perhaps the black and white outputs on the cable are sound channel outputs that could be combined with a signal combiner and used with the single 1702 audio input? Then that would leave the chroma and lumina signals with the appropriate signals on the 8bit cable.

I'm wondering if anyone possibly knows what type of cable this is and whether or not it will work properly with the 1702 monitor. I don't want to drive over and get this monitor if it isn't going to work with the 8 bit anyway.

Thanks for any info you can offer.

/Kevin

3863. Re: 6502 Overflow flag

Newsgroup: comp.sys.atari.8bit

From: lamcw@aston.ac.uk
Message-ID: <D82Auu.4Lz@aston.ac.uk>
Source record: 91991

smrgoodw@reading.ac.uk (J. F. Goodwin) wrote:

;Does anyone know what the overflow flag is supposed to be for
;in relation to the ADC, SBC 6502 instructions? All I've been able
;to dig up is that it is something to do with multi-byte signed
;arithmetic. Is this true or does no-one know?

The V (or overflow) flag is set after a ADC/SBC instruction when
the sign of the result is NOT as expected. In signed 8 bit
arithmetic, the values 0..255 are mapped to 127..-128 where the
MSB (i.e. bit 7) denotes negativeness and the byte is to be treated
in 2's complement).

So if you do the sum

127 + 1

you get 128 but in signed 8bit arithmetic, it's in fact -128
i.e. overflow and V is set to 1.

I believe the V flag behaves the same way in either BCD or binary
mode (don't quote me on that!)

Hope this helps!

Hello all,

I just received the new newsletter from Branch Always Software. Not only are they working on GEMulator 4.0, but they are also working on PC Xformer 4.0 and shooting for a summer release! It is a 130XE emulator similar to v.3.0 but it is said to be even more compaitible (sp?). It will be a Windows based program, so it will work with almost any sound card and, as with v.3.0, it will support pc printers, modems and joysticks. No pricing as of yet.
I also received a disk from them that had the GEMulator 4.0 preview program and a copy of PC Xformer 2.52, an updated version of their freeware preview program. If any of you are interested in that, let me know what site you would like it uploaded to and i'll make sure it gets there in a couple of days. One site i'll definitely send it to is James King's site at ftp.xmission.com

Sincerely,
- Byron Followell

Message-ID: <9505051152.AA15432@emh.kunsan.af.mil>
Source record: 91997

Over the course of writing FlickerTerm, I've become forcibly aware of a number of compatibility problems between DOS 2.0-compliant DOSs and the many SpartaDOS variants.

What I'd like to know is, has anyone compiled a list of the things a program must/must not do to remain compatible with ALL DOSs? So far the only major thing I've discovered is that if you (quite properly) exit a program with RTS, Sparta will crash, so you have to JMP (DOSINI) instead. Blech. I've also heard rumors about Sparta choking on legal uses of the RUN and INIT vectors in multi-segment disk loads.

And finally... how many different versions of Sparta X are there? It seems some people have to trouble running Flick under X, and some can't get it to run at all. I'd really like to find out what the problem is so I can fix it. Flick doesn't even touch banked RAM. Runs just as well on a 48K 800 as on a 320K XE.

Here they GO ! EMULATOR AS WINDOZE BAZED PROGRAM ? never herad of it,
i can imagine it right now.... i am playing river ride and suddenly the game
fucks up and i hear the sound of swapping.... or another one.. i am
playing
river ride and BOOM ! the fucking machine just locks up ... or another one
i am playng river ride and here it goes : GENERAL PROTECTION ERROR ! as
i remember it was not stable when it waz DOZ bazed program and my guess
iz that it will be the most phuqing slow and unstable emulator in the
whole history of emulation OR ! it will need minimum configuration:
PENTIUM 90 with 32 megs... and more what about Win95 ? that a big damn
mistake to write anything for windows when win95 gonna be out by the end
of august. Oh , they say win95 in *FULLY* compatible with windoze ... well,
well, well, who says ? i donno, i tested it and no hope so far :) all
versions since 347 to 456 are *NOT* fully compatible esspecially on time
consuming and graphics dependent apps (plus memory allocation). Or ! another
example... i am playing HENRY HOUSE and gotta jump in the very crutial moment
and TADA !!! ALARM CLOCK !!!! FAX !!! MODEM CALL !!!!! AHHH ! Of course
you may say: just quit all apps and enjoy... PHUQUE you ! if it is
a windows apps then it *MUST* be multitasked ! otherwise why the heck did
they
do it as win app ? to make it slower ? DO not tell me that it is cuz they
wanted to support all printers and sound cards and vga's.... you can find
thousands free ware driver for all of them... or you can ask for them from
makers. anyhow, my point so far is EITHER IT IS A JOKE or THIS PRORAMM IS
USELESS unless you have P5 90 with 32 mb

Maury said: "PBI? BB? MIO?"

PBI - Parallel Bus Interface, the slot port on the back of 800XLs/600XLs
(I think), 65XEs? Damnit..I forget :)

BB - Black Box, Hard Drive, Printer, Modem interface, plugs into PBI port

MIO - Multi I/O, Hard Drive, Printer, Modem interface, plugs into PBI port
(is older than BB I think.. BB's are better I think too?)

MIO2 is coming out soon from Fine Tooned Engineering.. IDE hard drive
interface (that's it, so far as I/we know at the moment...)

P:R:Connection is an old printer/modem interface like the Atari 850

R:P:Connection is a new P:/modem(R:) interface supposedly coming out from
Computer Software Services (I think that's what CSS stands for! :))..
(they're who made the Black Box along w/ a ton of other stuff and some
cool software (they hold the rights to MyDOS I believe, and Bob Puff,
the owner, wrote DiskCommunicator, SuperARC/UnARC, etc...)
Dunno if this is vaporware or not yet tho :(:(:(

Due to lack of space I am considering selling a used Atari 8-bit
system, as follows:

800XL upgraded w/Newel 256k mem - quirky at times seeing full 256k
1050 floppy - OK
XF551 - rarely used
1025 direct connect serial printer, uses common spools - avg cond
850 interface - avg condition w/printer & serial cable
MPP printer interface - good cond
HES sound box - poor condition, but seems to work
Extra power supplies for 800XL and disk drive
Extra serial cables
Manuals - 800 resource notes, mapping the Atari etc.
Cartridges - joust, necromancer, 2 copies atari writer, basic XL
Disks - 1st xlent, atari proofreader for ATW, assorted stuff

The only thing I have to add to Bill's answer is that the 65XE had no
PBI (er, actually ECI "extended cartridge interface" on the XE), which
I believe was the reason they didn't release anything to attach to the
ECI.
They apparently didn't want to release anything that wouldn't work on
all the current machines. I think somebody's logic was flawed
somewhere along the way...

> Why did they reject it? I cannot understand this.

Probably because they didn't want to have to release software on both
3.5" and 5.25". Look at the mess in the PC world, with some machines
only accepting 3.5" and others only taking 5.25", and the software
distributors often forced to put both in the box. That could get
expensive for a small software developer/distributor, especially since
3.5" disks are (or at least were) more expensive than 5.25".

>in a carry and hence the flag is unaffected?

The carry will be clear after the last operation. (The previously set
carry will have been added into a2+b2). This is what you want, because
if the highest byte of the operand does not overflow, then the carry
should be clear.

Heh! If their prices in the past were half as good as they are now,
they'd still be dealing with Atari 8-bit products. They just wanted too
much before. $20 for a XE power supply? That's why they have too many!
$35 for an obselete drive mechanism?

Get it immediately. I have a 1701, virtually identical, the picture is
great. The cable you describe is available, not sure where, most likely at
Best. They are not uncommon.
The only strange thing is, on my 1701, the Chroma and Luminance jack colors
are REVERSED, or the cable is. Weird. The Black cable is Audio and the White
is Composite Video.

Heh, that would mean that the Atari emits stereo sound from the
monitor port. This is quite unlikely, although I think at one time
that was considered for the 800xl.

>I'm wondering if anyone possibly knows what type of cable this is and
>whether or not it will work properly with the 1702 monitor. I don't want
>to drive over and get this monitor if it isn't going to work with the 8 bit
>anyway.

If it has a 5-pin DIN plug that fits the atari monitor jack, it'll
work. (Most of the 4-wire monitor cables I've seen are commodore
cables with 7-pin plugs.)

The colors of the wires are different on each cable, so you'll have to
check the pin-to-plug wiring matchups with an ohmmeter or continuuity
tester, then look at a list of the monitor pinouts (in the FAQ).

I don't remember the pinouts but here are the functions of the wires.

+ audio, (black on my cable) which can go to either of the two audio
jacks on the 1702.
+ composite video, which can go to the front video jack.
+ luma., which should go to the luma jack on the back, and is also
perfect for monochrome monitors.
+ chroma, which should go to the chroma jack on the back. This may
not be active on your machine, but with some soldering it can be done.
(This is where the second audio output was going to be, which is why
the XLs don't have it connected.)

- ground, connected to the shield/ring of all four wires.

If you have chroma, you'll get the best results with the separate luma
and chroma on the back, otherwise stick with the front or modify the
computer to put out chroma.

You will get a picture with composite on luma or chroma, but it'll
look better if you put everything in the right place.

: Sparta will crash, so you have to JMP (DOSINI) instead.

WRONG! This is not true. All of the programs of which I have written, i have
exited by merely using a RTS. It works great and wonderful for me.
It appears that you are doing something which changes the environment
and that is making sparta crash.

I have just returned from an archeology expedition deep in the back of my computer hutch. I have found the following items that I don't need. Surely somebody does! All prices are flexible, make an offer if you think my price is too high. Shipping will be paid by the purchaser: $2.00 for the first item, $1.00 each additional (unless otherwise noted). Software comes with original box, disk, and documentation unless otherwise specified. All prices are US dollars.

*** NEW ITEMS MARKED WITH A ! ***

Commodore Games:

Microleage Football (Disk--Microleague Sports) $8.00
-Football Simulator.
John Madden Football (Disk--Electronic Arts) $8.00
-Football Simulator.
War In The South Pacific (Disk--SSI) $8.00
-Three WWII Pacific Ocean battle simulations.
Elite - Gold Edition (Disk--Firebird) $10.00
-Space rogue game...trade between planets and
equip your ship for battle. 3D graphics!
! Gunship (Disk--Micro Prose) $FREE
-AH-64 Apache Attack Helicoptor simulation. Have
disk, keyboard overlay, box. Manual is required
for copy protection (AS IS).
F16 Combat Pilot (Disk--Electronic Arts) $FREE
-F16 combat simulation. Have disk, box. Manual is
required for copy protection (AS IS).

Commodore Applications:

Hes-Writer 64 (Catridge--Human Engineered Software) $2.00 (*)
-Text editor/word processor. No box or dox.
($1.00 S/H)
Sideways (Disk--Timeworks) $10.00
-Prints following spreadsheets sideways:
Better Working, Calc Now, Cal-Kit, Creative Calc,
Multiplan, Practicalc, Syncalc, Trio, and any SEQ
file. Works on Commodore, Epson, Okidata and a few
other printers. Supports both 64 & 128.
News Maker (Disk--Free Spirit) $10.00
-Desktop publishing for C= 128 w/RGBI monitor. Box
is worn.

Commodore Hardware:

! Aprotek "Com-Modem Adaptor" w/RS232 cable $10.00
-User port RS 232 interface + 4 foot DB25 cable.
! Commodore 1531 Mouse $20.00
-Good shape/working w/box, manual, & test/demo disk

IBM Software:

Central Point Backup 6.0 (Central Point Software) $8.00
-Older version but, as far as I can tell, the only
change in the newer versions (7.x) is the user
interface. Backup to tape or floppy ($3.00 S/H).
QEMM 386 6.0 (Quarterdeck) $8.00 Sale Pending
-Compatable with MS-DOS 5/6 and Windows 3.x to
give up to 625K to DOS applications.
Desqview 2.4 (Quarterdeck) $8.00 Sale Pending
-DOS multitasker. Grab QEMM for best results.
DR DOS 6.0 (Digital Research) $8.00
-MS DOS clone. Does everything DOS 5.0 does plus
some of DOS 6.x's (drive compression, memory
management, undelete utilities, etc.). A VERY
nice alturnative to MS DOS & takes half the space.
($3.00 S/H).

Books:

Card ?+G Printer Interface Instruction Book $1.00
-Instruction book for Card ?+G parallel interface
by Cardco for Commodore 64/128 ($1.00 S/H).
C2N Cassette Unit Operating Instructions $1.00
-Instructions for Commodore "Datasette" ($1.00 S/H).
! Atari BASIC (XL Edition) $5.00
-BASIC instruction manual on Atari XL series
! PowerPC 601 RISC Microprocessor User's Guide $8.00
-Technical reference for Power PC CPU, direct from
the creators, IBM & Motorola. ($3.00 S/H)

Please respond by E-mail.

Galen Tatsuo Komatsu (gkomatsu@uhunix3.uhcc.Hawaii.Edu) wrote:
: Does the 1050 (I think that's the number) disk drive and the
: 400 computer both use the same type of power supply?

yes, they both use 9volts AC..... there were two types of this model p/s
one that was known to blow from time to time (some were fixable but dont
remember what was blown to say...) the others were rock solid.... so make sure
you have voltage coming outta the p/s...

: Recently visiting again, I ran into the 1050 drive (also
: a casette drive, both I'm presently passing up since there's no
: I/O cable) and nearby were a bunch of PS like the one I picked up
: with the 400. Looking at the 1050, it appeared to have the same
: power input, so I was wondering if they both (400 & 1050) use
: the same thing, or different ones (and I'm using the wrong one
: for my 400.)

i'd say go for it (if its still there.....) the 1050 is a decent drive and even
if it doesnt work its good for parts (if you already have one on your 800xl
...) some parts for it are hard to get...

: Anyway, anyone want a 400 & power supply? (without any
: major effort, I can't get it to work, maybe you'll have better
: luck) I really don't need it...I have an 800xl (if anything, I
: was only interested in the 4 controller ports and the joys of
: typing on it's rock-keyboard. =^) Will trade for cartridges
: and stuff...
: --

sure... but only if you buy the 4-400's i have here :)

From Zaks' Programming the 6502:

It is used to indicate that the result of the addition or subtraction of
two's complement numbers might be incorrect because of an overflow from
bit 6 to bit 7, i.e., into the sign bit. A special correction routine
must be used whenever this bit is set.

Hope it helps.

I believe the 6502 if I remember correctly was designed in 1976 by MOS Technologies......eventually to become a division of Commodore.

The PIA 6520 was not an Atari custom chip and was designed by the above group as a support chip for the 6502 family.

POKEY was designed by Doug Neubaur <spell> of Starraiders fame. POKEY was finished before the other custom 800 silicon and amazingly worked on its first pass. Starraiders was Dougs attempt at showing what the chipset might do.

The GTIA was preceded by the CTIA used during the first year of production. The GTIA was actually finished first but had some bugs...it provided more levels of luminence and more graphics modes. I'm not certain who was the real designer of the CTIA or GTIA. The GTIA was rumored to really stand for "Georges interface adaptor" but I never knew who George was! The late great Jay Miner had already left Atari by this time after designing the VCS TIA.......his replacement as far as I remember was Francis Michelle who later designed the "Sylvia" Chipset. This was a somewhat strange 10 bit system that never got as far as silicon. There were a few cool games on the simulator for it....Pac Man with a Rat as I remember......but the programmers hated the system.

The mortal Maury Markowitz wrote:

: Why did they reject it? I cannot understand this.

Software companies didn't want to have to stock 2 different formats.

Software companies were even loth to switch to enhanced density even years after the 1050 came out.

It was really Atari's fault for not making a DOUBLE DENSITY drive the standard back in 1978. A 70K drive for a machine with 48K RAM is not a good thing, but a 180K drive would be ideal, and double sided 360K would be more than enough for even 128K programs.

I know of no other home computer that actually went with single density single sided. The C= drives may have been slow as molasses, but they WERE double density.

Atari had a DS/DD dual drive (the 815) but it was never released, and although there were a plethora of 3rd party drives that provided this, it never caught on enough. Plus DOS 2.0S was pretty shitty about handling anything but SD/SS and ED/SS. 2.5 and DOS XE were too little too late.

No matter what part of Atari8 history you touch on, it is laced with decisionmaking misakes on the part of Atari. Some didn't seem like mistakes at the time (like this) but were bad in the longrun. Other stuff (like how Tramiel handled the 8-bit) was more damaging.

: My question is, what would I need to attach one or both of these to my Atari
: 800 (the original, not one of the XLs...)?

The only good solution is gonna be a slow solution.

But if you do the heavy mods necessary to install the MUX OS in the 800
and then plug in a MUX and use an XL or XE for the master, you will be
able to use your 800 with a HD.

Any PBI-less XL/XE like the 1200XL, 65XE, or XEGS is MUXable and therefore
can cheat its way into the hard drive domain.

The man reason was this: at that point, the commercial support base was shrinking. Forcing companies to produce software with both 3.5 and 5 1/4 disks would have further reduced commercial support. So, Atari went with a 5 1/4 instead, to retain downwards compatibility.

I don't know of any HD->800 interface besides the Corvus system, with its
whopping 7 megs. I think it used a custon DOS and hooked in via joyports
3 & 4. The HD would be partitioned into 90k "disks".

On a semi-related point, the Smalls at one point provided high-speed disk
interfaces that hooked in via one of the memory slots on the 800. Anyone
have any experience with these? Anyone have any neat hacks that
interface via an 800 memory slot? There's a lot you could do with it, if
you wanted to...

I think, if the program runs with DOS 2.5, it also work with all DOS,
but you can't use the special advantages of SpartaDOS (e.g). Important
for SpartaDOS: Don't use the RAM under the OS and the MEMLO is higher as
with DOS 2.5.
I know the X-Cartridge V4.2 and 4.21. FTe distribute Sparta-X V4.21.
Differents? I Don't know, but don't forget, that you have some options
to eXecute a program...

>bjcorr@delphi.com

It's your cable, not the monitor. The colors are correct for C64 monitor cables. I have an 8-bit monitor cable just as you described. Its colors are different (wrong? I think my cable is a standard Radio Shack 5-pin-din-to-4-RCA cable, so there's no frame of reference for wrongness).

But it's still confusing!

I have another question:

Is the split video output of the Atari 8-bits the same as the output of the C64? Are either (or both) compatible with the S-video standard?
(i.e., if I had a nice TV with S-video inputs, should I bother trying to make a cable from the 8-bit to the TV?)

SpartaDOS does that on disks formatted in its format.

I suppose it might be possible to have a special file to keep the
timestamps on a DOS 2/MyDOS disk, but it would require a special
handler, and I don't know of such a scheme.

Yeah, I just didn't see the need to complicate my response even more.

I attempted a GUMBY upgrade in my 1200xl (everything's still in
there), but I never got it to work. I may take another look at it
someday.

>Not much supports it though, unfortunately. :(I wish it were a standard..
>
>Heck, I wish 1024K, a HD and GUMBY were standards! :)

At this point I think those writing software should feel free to take
advantage of any upgrades out there. Otherwise there's little point
in improving the machines.

Didn't ANALOG print something about a stereo upgrade once? Maybe I'm
imagining it, but I seem to remember considering combining something
else with gumby to get even more sound channels....

I think it had something to do with the clock in/out pin on the SIO
connector, and getting one or even two extra channels of sound....

How you launch a program with SD is important. In order to run some commands or programs that don't have a RUN vector SDX just jumps to the first byte in the file. Unfortunately, it does this even if you use the INIT vector instead of the RUN vector. I could see it doing things like loading the RS232 handler twice & bumping the memlo or maybe just JSRing to a piece of code that crashes the computer. What I do if I want complete compatability across DOSes is start all my stuff that has to use the INIT vector like:

```
.ORG ;where ever
RTS
INIT
;real code
*=$2E2
.WORD INIT
```

I've never had a problem when doing it this way. You should find out if people are launching your program with the X command also.
Rick

Well, it seems Portal's been a little quirky getting my post to newsgroups out lately. If this message is followed by a redundant post, that's the reason. Several post seem to have been lost in the ozone lately.
Anyway, yes Bob just sent me E-mail asking for an article with the 7400 version of the SIO2PC cable for the NEXT ISSUE OF AC! It's my understanding that Jim Hood handled all the publishing duties so I would expect the quality to slip a little when he got sick. Bob is constantly besieged by people asking for help. He's also quite normal in that he has a real job, wife & kids, & is active in the SLCC. He runs about 6 months behind in projects because of this. Give him a chance to tell people "No, I'm to busy!" for 6 months to clear his desk & put up with some crappy articles articles about sio2pc cables by people with cognitive learning disorders for a couple of issues & I'm completely confident Bob will pull it out.

>
SDX has (at least) versions 4.18,4.19,4.20 and 4.21. Bob Puff describes
it as "flaky" in his BobTerm docs, adding that he had to patch it for
full compatibility, after futzing around for a while trying to get BobTerm
to work properly.

I think (but check!) that OPENing E: then RTSing will return to Sparta
properly as well; since Flick is using a custom display that may be the
source of the JMP (DOSINI) requirement

I recently picked up an Atari 1027 printer without power supply (or manual). Can someone tell me what the power supply is?
(The usual-- AC/DC, voltage, polarity, etc.)
While it looks like it at first glance, the power supply is NOT the standard Atari 9vDC that operates the 1050 drive, etc. (Or if it is, the socket is different-- about 3mm.)
Please e-mail me at 73430.1546@compuserve.com
Thanks!

Douglas Neubauer was interviewed in ANALOG #47. But his memory
differs, "The Atari 800's architecture evolved as an upgrade of the
2600. Conceived primarily by Steve Mayer, Joe Decuir and Jay Miner before
I arrived at Atari, the original plan for the POKEY chip called for
keyboard interface, audio and paddle controllers."

As for the game,

"Star Raiders was to be a 3-D version of the Star Trek game played on the
mainframe computers of that time. The Star Trek game was all text and not
played in real time, but it had the idea of ship damage and sector
scanners and charts."

"It also used names like "commander" or "super commander," which gave me
the idea of a rating rather than a score. While at National, I did up
some demo screens of star backgrounds, and the whole thing seemed
feasible -- but I didn't get to implement it until a couple of years
later."

Body handling: HTML body converted to readable text

Clay; Doesn't matter what you do, *every* RS232 handler uses the INIT vector
so you can append term programs to them. It probably isn't the problem
though as I think your RUN vector in flick would stop SDX from jumping
to the 1st byte for an appended file. It could be that people are using
a .BAT file to load the handler which would create problems though. The
X command just shuts off all cartridges, for instance, if you want to use
a cart like MAC/65 while you testing a program that uses memory right up
to $BFFF you'd start it with 'X TERM.EXE'. That way you'd never have to
remove your MAC cart. This is well documented, but has bit me before when
I got lazy about an intro screen. There's actually a need for doing things
this way. For programs written in Action! w/o the runtime appended to
it, you can run them from the command line with access to all the canned
code in the cart. I'm pretty sure it's just a trivial problem, if nothing
else you should be able to tell people to flick on a DOS II disk as
AUTORUN.SYS & start it with 'COLD /N'
Sorry I can't be of more help on the bug hunt, other problems/projects
have prevented me from even taking a look at flick so far.
BTW: Any comments made by Puff must be taken in light of he was a
competitor with ICD. I was there on CI$ when he first demoed the
program. At that time ICD & OSS were present daily to answer any questions
about there products. I recall he asked maybe one question which ICD
answered immediately. Any claims of flakeyness should be backed up with
examples. I'm not saying he didn't have problems, it just that 8 years
later I never heard a single specific example of just what the problems
were. .
BTWII: Initiate vectors are not that bad of an idea, it's just that you
haven't had a need to use them yet. For instance, someone on the old
Carina net once asked me to write a program that would accept a frequency
from the editor, set the joystick port interface from it, then proceed
to load his packet radio program. At least for his purpose, the
1st two programs used INIT vectors with the packet radio using the RUN
vector. My code used the same memory space as his packet program, but once
it had done it's work, the packet program loaded over it. It's something
you may want to consider for the code that sets up your original display
list/80 column mode if you get really pressed for space.

Question: would someone please point me a source for 800XL hacks? i.e.
more RAM, stereo upgrade, pokey chip upgrade/installation..

In addition, has there been a hack built that automatically turns off
basic? I'd love a switch of some kind that would turn it off until I
wanted it back on.

I only post this because there is Atari 8 bit stuff here, both for sale
and wanted.

2600
Starmaster
Berzerk w docs
Outlaw
Qbert
ET
Joystick remote control unit by Atari, with 1 controller. No idea if this
works. (Can someone tell me if I can try this with a 5200/2600 Adapter?)

Atari 8bit
One-On-One, original floppy disk. no docs or box.

Colecovision (no docs/boxes)
Miner 2049er (may have pending trade on this..)
Donkey Kong
Colecovision overlay for Super Action Controller Front Line (1 overlay only)

DOCS (I assume most for 2600??)
Star Raiders
Joust
Centipede
Alien
Moon Patrol
Bugs (may have pending sale)
Space Attack
Concentration
Frogger
Space Invaders

Boxes only (is anyone interested in these?)
Pitfall I, II 5200
Ballblazer 7800
Asteroids 7800
Donkey Kong (took some mangling) 7800

Atari 8 Bit
(1) 600XL with Pwr Supply

Atari Power Adaptor C062195 (for use with 1030 Modem only)
(1) Percom full height/width floppy disk drive, no idea of specs, assumable an AT88 (so SS/ED?) (will provide copy of at88 manual if desired)

TRS-80 COCO
What must be a Coco to Atari Joystick adapter

Lots of comics (Green Arrow 1-60, Faust, lots of assorted)

Many little RF adapter thingees, and TV hookup doodads, if you need it, I've probably got it.

WANTED in priority of want

Wanted: 5200 controllers, in working condition.
Wanted: Disk with appropriately free Atari 8 bit DOS, with XL translator program, term program, other utils. (MPP won't speak with USR 28.8)
Wanted: 7800 games
Rampage
Commando
Rescue on Fractulus
Winter Games
Xenophobe
Wanted: Power supply for Atari 1050 disk drive (Pleeeeaaassseeee)
Wanted: Hard drive for Atari 8 bit, any size 5MB+ (trade for most of above stuff, if not all)
Wanted: Instructions (copies ok) for Atari compatible Percom drives, beyond AT88 manual
Wanted: Pitfall I and II for 2600/Atari 8 bit systems (disk or cart).

Wanted: Atari 8bit OS/A+ upgr. (I have 2.10, would like any more recent vers.)
Wanted: Atari 8bit games on disk or cart.
Wanted: Sega Genesis shooters/action/adventure
Wanted: Sega Genesis CD drive
Wanted: Robert Jordan's "The Great Hunt"
Wanted: C-64 system (preferably with a disk drive)

All things are negotiable. I will deal very unevenly, in your favor! I'm NOT out for money, or to cheat you, so let's talk! I would much rather trade, which allows postage to fall on me for the stuff I ship out, and the other person for what they ship out.

You're right. However, I think the ol' PC Xformer is worth mentioning too. It's not perfect, but having a "virtual" 8-bit Atari inside a MS_DOS box is still more fun than not having one at all. Is there any other way to get the best-quality video possible....8-bit Atari graphics on a .28mm dot pitch SVGA monitor! I still smile widely when I run the emulator and see GR.0 text in SVGA clarity.

Hopefully with some improvement, the 4.0 version of PCXF will make things more compatible and offer additional features. While far from perfect, PCXF will keep my memories of the Atari-8 experience burning for some time....particualry because all I need to do to turn one of the ubiquitous PC CLONES into an Atari 130XE is carry a 3.5-inch floppy!

James

: Right, I didn't know the name. I thought that it was simply a CPU bus
: stuck into a connector? Was it the same on all the models?

The interesting thing is that the cart connector and the PBI share similarites. So much so that the XE uses a CART+ECI system rather than the independent cart and PBI ports on the XLs. The cart port is really quite versatile. I don't know exactly how the MUX works, but that and the easyscan(?) cart manage to slave the cart for fast I/O duty with about 85-90% of the efficiency of the PBI port. I have to imagine that people were really ignorant of the potential of the cart port not to have taken advantage of it more. I've of course heard rumors of all sorts of PBI-ish interfaces and devices for the cart port but nothing substantial.

The problem with ECI is of course, plugging in carts while using a PBI device. The MIO solved this with a little $20 adapter with 2 cart ports on it (one was designed for the R-8 I believe) and the BB has a single cart port.

If you want to talk about bus overload, try an XE with a Black Box, and a stack of a MUX cart (leading to another BB on a master), Sparta-X, an R-8, and a language supercart. That's at least a foot heigh of carts and electronics going through that port. On the BB this can be a problem because towers of this sort tend to lead to crashes with vibration. Some means of steadying it is important. Stacks like this work best on a side-loader like the 1200XL or the native XEs. When I had my 1200XL running the BBS, I had my stack hanging out a good 10" on the left.

Yes, there are actually 3 chip areas which can be stacked:

PIA (lots of I/O projects you can do, including alternate ram banking methods which are technically better than the current methods although of course, incompatible)

POKEY (Gumby upgrade)

GTIA (Bob Woolley was working on this but I don't know how far he got).

I think I was right in assuming that Bob Puff's change of heart regarding the viability of the R:P: and putting that on permanent hold and indeed the doldrums over at CSS signalled the final downturn in the Atari8 userbase. I got similar feelings earlier when Bellcom said farewell to the A8. It's not too soon to consider stalwarts like B&C as possible casualties at this stage. And after B&C and Best go, what's left?

You wouldn't believe how dedicated Bob was to get that thing finished. "One way or another I'll find a way to make a run because I know some people out there could use it" is what he told me paraphrased. He had to have gotten some really bad indicators to give up.

At this point FTE is the last best hope for an Atari8 future. And I'm sure FTE is continuing only out of the lunacy of its founder rather than any positive economic gain that comes from it.

And although I'm still hoping FTE delivers some good stuff, I'm already disappointed with how long it's taking for things to materialize. They mentioned a new MUXABLE SDX from the start and I doubt that has even been worked on at all. There was also talk of video upgrades which seems to have disappeared into vaporware. I'd also like to know when the next OFFICIAL bugfix revision (ahem, John?) to Sparta 3.2 is going to be available. To date, the "a" patch by Steve Carden is being circulated as a de-facto replacement for fte's 3.2 revision. Also, with the plethora of banked ram upgrade options available, why not a BXE that banks out more than just 128K, or an Action! XE? And if the 65816 system hardware is not followed with operating system enhancements which take advantage of it (new OS and/or DOS) and ANSI C, it will go over about as well as Chuck's T816 did. I think perhaps Mike was overly optimistic about how much his limited resources could accomplish.

>history.

A magazine interviewed Doug Neubauer and he described his work on Star
Raiders. He received *no* royalties from the cart, a flat sum which
was real small. He took the idea from star-trek, a popular BASIC game
and added features to give it a 3-d like effect. Atari was not known
for giving their programmers and engineers credit for their work.

BTW: This is old news.

Rich K.

Ah, but does it work great and wonderful for anyone else?

During pre-release beta test of FlickerTerm, I got numerous reports of Flick locking up Sparta on exit. Changed the RTS to a JMP (DOSINI) -- problem disappeared.

> It appears that you are doing something which changes the
> environment and that is making sparta crash.

Could be. What parts of memory should a Sparta-compliant program avoid? I know the command processor sets aside a buffer for batch processes and stuff like that.

And... any recommended minimum assembly address?

> No 8bit has S-video that I know of.... There is the SuperVideo
> upgrade to the XL's but that is something completely different.

Actually, the 800, XL (some of them), and XE all support S-video straight out of the monitor port. Of course, back then it was known as split video, aka Y/C video, aka chroma/luma video.

Leave it to those wonderful marketing types to come up with yet another name. But then, we're dealing with a consumer base that can't even keep "S-Video" and "SVHS" straight.

> describes it as "flaky" in his BobTerm docs, adding that he had to

Oh, great. Okay...

*** A REQUEST ***

If you have tried using FlickerTerm v0.37 and up with SpartaDOS X,
please send me private email describing what version (of SDX) you
were using, and whether or not it worked.

Thank you.

> I think (but check!) that OPENing E: then RTSing will return to
> Sparta properly as well; since Flick is using a custom display that
> may be the source of the JMP (DOSINI) requirement

Flick executes a GR.0 command (or rather, the XIO equivalent) before
exiting, so I don't think that's the problem.

The cable colors would probably match if you were using a C64. Although
Commodore and Atari both used 5-pin DIN plugs, the pinouts weren't
standardized. (I think the C64 monitor jack has more pins, but a 5-pin
plug fits).

Hello All,

I've started using the old ST XFormer and PC Xformer again. I'd
like to make an XFormer cable so that I can hook my 8 bit drive
directly to my ST. I know there was a pinout / instruction file
floating around at one ti
me. Can someone direct me to this file or tell me the pinouts of the
cable ends so that I can make my own? It would be greatly appreciated.
Thanks in advance.

Sincerely,
Byron Followell
followel@ix.netcom.com

P.S. - I'm sure i'll have several posts concerning where I could buy a
cable or people who are interested in selling me their old one's,
however, as I have ton's of spare parts around the house, i'd like
build my own.

Decided to take down my multiplexed network and instead stick everything
I had onto one powerful Atari.

Net result is that I now have about 5 times more items than I need, to include:

4 x R-time8 carts
2 x Stock 800xl's
1 x 65XE w/SuperVideo and Audio upgrades
1 x XEGS (socketed ROM) with 15' extension cable for keyboard
1 x 130xe (socketed w/SuperVideo and Audio upgrades)
1 x 256k MIO w/all cables (including modem and printer)
4 x Misc. brand printer interfaces (Supra, Ape-face, Axiom, etc.)
1 x 850 w/all cables
1 x PR:C w/all cables
1x Commodore 1702 split luma/chroma monitor (excellent for use on SV2.1)
1 x Hayes 2400 SmartModem w/power supply and Atari serial cable
1 x Happy (the REAL thing) 810 w/power supply and 2 IO cables
2 x Indus GT drives w/ power supplies and 2 IO cables each
1 x TRAK ATD4 (very rare) drive w/2 IO cables and Power supply
1 x 800xl (fully socketed w/SuperVideo and audio upgrades)
7 x Seagate ST225 half height MFM hard drives
1 x Seagate ST4096 full height MFM hard drive (80meg)
5 x 1.22meg and 360k 5.25 floppy drives

Make *reasonable* cash or trade offers. I prefer to trade, however.

Hi Everyone!

Well, the past few weeks have been interesting to say the least.

Some last minute decisions have had to be made, with the result being that

Fine Tooned Engineering HAS MOVED TO ARIZONA. Just when things were starting

to settle in and get organized... Moving can be traumatic enough, but moving

a business is even worse! (believe me)

Things are running behind schedule again, and as soon as I can get

unpacked and set up again, I'll be able to post more info and release dates.

The "new" address is

Fine Tooned Engineering

PO Box 31270

Mesa, AZ 85275

If you've mailed something to the old address, don't worry. That

box will still be active for a short period of time. The mail will take a

little bit longer to get here though...

(On the brighter side of things, FTe probably won't be moving again

for a while. <grin>) Thanks, Mike

: -Bry

Hmmm... Sounds like they just may not like being near Sparta. Try the
whole routine using a different DOS (It won't hurt) and booting from a
1050 drive (some of these Euro-demos REQUIRE a 1050 and nothing else).
I've gotten Bitter Reality and the CMC_DEMO and they work just fine.

The Bitter Reality demo is IMHO, the best one yet. Too bad I can't get
the Shake demo to work (incompatibilities).

BlI purchased a PAL XL and put in an NTSC GTIA. This seems to work fine
Blfor me on NTSC monitors. (oh yes, I also had to replace the 3.579MHz
Blxtal for some reason or it would not load from disks).

Which disk drive? Was is the XF551?? For some reason, atari made a stuff up when they first programmed those drives. It would not work real good on pal machines. Atari came up with a fix which will work on all machines. other atari drives don't have this problem. I have the rom code here if you need it.

MlI've just heard of something that might interest users of NTSC
Mlmachines. One of the club members in the States has come up with a
Mlhardware hack that will allow US Atarians to run European software
Mlwithout any problems (apparently). He's set to start advertising it
Mlsoon (if he hasn't already done so. I'm trying to catch up with my
MlEaster mail :-)

What i have been saying all along is for NTSC users to get a PAL antic chip
from Best electronics. This will work. The only thing i cannot say is what
colours you will see. I know the hack works because i tried it on an ntsc
machine before i changed it to PAL. I don't have a ntsc monitor/tv so i
could not test the colours.

I was pleasantly surprised to discover a real-world use of our venerable but still highly functional Atari 8-bit computer literally on display at the University of Maryland Medical Center in Baltimore, Maryland.

The Medical Center uses an Atari 8-bit to broadcast closed circuit announcements and information across a multi-building wide television network.

I was waiting for an elevator, watching the TV monitor, when I suddenly realized I was staring at the now very familiar standard default Atari 40 column font with a horizontally scrolling banner line at the bottom of the screen!

I called their public affairs people and they have been using the Atari 8-bit for the past several years on contract, because it works quite nicely for them as an information and announcements display vehicle for their staff, patients, and visitors, 24 hours a day!

It is also very cost effective and easy to update the announcements, information, and schedules of events, times, dates, and programs at this very large medical center in downtown Baltimore.

It was great to see the Atari 8-bit in action!

Anybody else care to share any continuing and current real-world use with the Atari 8-bit? Might be kind of neat to discover where else the Atari 8-bit technology is quietly being put to use!

Tom

50/60Hz Problem

Just catching up on some old email I noticed this thread & realized it is mis-titled "50/60 MHz Problem". Gosh whiz, peoples, don't we all know that NOTHING on the 8-bit runs at 50MHz or 60MHz? (Tho all of us have probably wished at some time it could be so!).

RE: Bryan Edewaard's post of 4/26/95, where he mentions replacing a PAL GTIA with a NTSC GTIA...

Bryan, are you *sure* it was GTIA you replaced & not ANTIC? I've never heard of a PAL GTIA. ????? I'm curious about this. What was the Atari part # on the chip you removed?

There's a guy in my usergroup, in California on a student visa from Israel, by the name of Nir Dary. He recently developed a hack for the 800XL that allows the XL to run both PAL & NTSC software. The hack involves an OS ROM upgrade plus replacing the NTSC ANTIC with a PAL ANTIC. He claims this upgrade will permit North American users to enjoy all the neat European graphic demos & games without wrecking the operation of their NTSC-dependent software. He keeps promising to send me one of these things (for beta testing in an upgraded 600XL), but I haven't received it yet. When I last spoke to him he was working on locating a large supply of PAL ANTICs & making arrangements to import British & German software. He doesn't have a home phone & isn't on a net, so keeping tabs on him is difficult. Dunno what the status is at present.

I made this point when this thread was started, I hope people know that whoever started this thread made an error, it is Hz, not MHz. And I mostly wished it for my Commodore with the 1541 disk drive. :)

Your friend's project sounds interesting, but I would like to see proof that it wouldn't 'break' any NTSC software. Do you have any idea what the OS modification is?

3959. Jan/Feb AC: Some Concerns

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-07 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505080118.AA117245888@relay1.geis.com>
Source record: 91900

Jan/Feb AC: Some Concerns

Please note the above title of this post. The emphasis here is "Concerns".

In my previous post on this subject I made some valid criticisms of weaknesses I perceived in the recent issue of the New AC (the first issue this year & the first in 6 months) and expressed concerns related to the management of the publication which have implications for its future existence. Things have gotten rather much twisted & out of hand here.

Now suddenly I am accused of "AC bashing" & a purveyor of negativism.
My god!

There was once a time when serious issues & problems facing the entire user community could be aired frankly in this forum. The discussions that took place here in 1991-1992 which led to the founding of AC in 1992 were often heated but not sidetracked by personal attacks on the people who raised issues.

So, then, I take it there are no problems out there? All the many Atari magazines are doing fine & hunky-dory, are they? New users & vendors are coming into the market in droves, right? We all have visions of sugar-plums, so all the posts here should just be dripping honey & waltzing Goodie-Twoshoes? And all is well in the Great Land of Atari? [Excuse me while I throw up.]

It was not my intention to turn people against AC. I had hoped people would examine the issues I raised & propose SOLUTIONS instead of knee-jerk reactions and personal attacks. Must I assume this forum is no longer composed of individuals who wish to suggest answers to difficult situations? I sure hope not!!!

The people who personally attacked me for raising the issues I did are not cognizant of all the particulars. I am compelled to set the record straight.

One person suggested that if I were unhappy with the magazine's content I should submit material myself. Of the 11 issues published since 1992, 10 of them contained articles I contributed. I have EARNED the right to criticize the publication's content! Look on the inside back cover: you will see a note about an upcoming article from The 8-Bit Alchemist. I hustled my butt in November 1994 to get that manuscript in to AC in time for the Dec '94 issue (the one that got concelled) in response to a request from the present management. Anyone who accuses me of not supporting AC with timely article submissions is just taking cheap shots.

A British reader who is apparently satisfied with the present offering, but who never subscribed to the "old" AC, trashed the entire previous history of the mag's record on the basis of having seen one article from a previous

issue that he didn't like. The "old" AC never published an article on "Sticky Labels", so I must challenge the legitimacy of that comparison. My suggestion is for that person to buy all the back issues (they're available from the present Editors), & THEN make a comparison between the present & past performance of the publication. If you aren't willing to put your money where your mouth is, then keep your mouth shut.

CN's 8-bit Editor mentioned postcards I sent to AC. Yes, I did that. The cards were mailed early in March. They each said "Where the hell is AC?". One was sent to Bob, and one was sent to Jim. Being a paid subscriber since May 1994, I was well within my rights to send such an inquiry when 6 months passed by without either a magazine or a note of explanation. Being also a consultant to the current effort, & having been involved personally with Bob Woolley & Jim Hood since their acquisition of AC a year ago when they approached me to resurrect it, I'm aware of a variety of behind-the-scenes issues I don't feel at liberty to divulge here. I was less than impressed that Bob Woolley printed my inquiry in the Letters column, accompanied by a flip response, almost 2 months later.

Being unemployed & 3,000 miles from California, I'm not disposed to make chatty long-distance phone calls to AC or anyone else. On April 17 I submitted to them a long serious letter expressing my concerns for the health of the publication, questioning their management policies, & offering some suggestions. As of this date (May 7), they have failed to respond either in writing or by e-mail. I'm making genuine efforts to communicate, but the failure is at their end. I do not really expect a response from Jim, but there is no excuse for Woolley's deplorable policy of ignoring mail in light of his position as Editorial Director. A serious letter from me, in my triple capacity as paid subscriber, contributor, & consultant, ought to be something he would notice.

I once again reiterate my strongest concern: the Jan/Feb issue REPUBLISHED ITS OWN MATERIAL. ("Keycode Getter" was originally published in the Jan/Feb 1993 issue.) The nature of the response to my original post suggests, incredibly, that everybody out there thinks this is OK. Does no one out there realize that for ANY publication to regurgitate its own material & serve it up twice is a backhanded way of ripping off paid subscribers? Would Current Notes do that? I think not: Joe Waters at least is a man of integrity & runs a tight ship. To make matters worse, the original publication of Keycode Getter was itself a blooper. As Allan Palmer, Mailbag Editor of Page6 embarrassingly pointed out in the Letters column of the April 1993 AC, the information in Keycode Getter may be had in Compute!'s Third Book of Atari. Don't take my word for it, check it out yourself.

Since everyone out there thinks it's OK for magazines to recycle old articles, why not carry the policy to its extreme? Just print up a zillion copies of one single issue, then send it out 6 (or less) times a year to people, & collect a full subscription price. Sound OK to everyone? Aye or Nay?

Since the mailng of notices to paid subscribers in August 1994, one issue of New AC has been skipped, 2 issues were grossly late (2 months or more), & the next issue will also be late. May I assume that virtually everyone out

there (myself excepted) would judge this record acceptable?

The magazine's Chief Editor is seriously ill & physically impaired, for how long no one knows. Its Editorial Director is clearly not up to handling the load & seems to be almost in a state of denial concerning the seriousness of the Chief Editor's circumstances. And nobody out there finds that even a little disturbing? (Again, myself excepted.)

And does everyone agree that people like me, who raise serious concerns that affect us all, should be personally attacked & branded a "Basher of [fill in the subject]" just because I have the guts to frankly address difficult issues in a public forum? May I assume that's the prevailing sentiment in this newsgroup nowadays?

If all the above assumptions are indeed true, then perhaps it is time for me to seriously reconsider the wisdom of remaining an Atari 8-bit user. I've never been able to accept my Atari 800XL as a "hobby", as many people now seem to. From the very beginning in 1984, I have always treated my 8-bit as a REAL COMPUTER. If I can't take my Atari seriously, & deal seriously with the issues involving it, I'll be compelled to seek another platform that I *can* take seriously.

- Ben Poehland

3962. What I been doing A8wise

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-07 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995May07.234409.15582@wariat.UUCP>
Source record: 91903

1. Unzip: I haven't touched it in months. I'm presently trying to get a C or C++ compiler to fiddle with Charles Marslett's 'Util'. This way I can sneak up on C or C++ and maybe later come up behind the sadistic code in 'Infozip'.

2. Hardware stuff: I have an old 800xl board that is/was completely socketed. I screwed it up trying to use it as a junk yard and now I'm trying to restore it. In the process I've screwed up my 256k 800xl and trying to fix that. BUT, I found a solder splash, a bad transistor (probably shorted it out myself) and hardest yet to find, I found a solder bridge under one of my socket installations. (I had ripped out some sockets on this completely socketed board.) Oh, yes, I said in an earlier post that the collector has the arrow pointing away from the base on a transistor. I found out the emitter is ALWAYS the one with the arrow in circuit diagrams. Whether it points away from or toward the base depends on whether it is a PNP or NPN type. All I know about a transistor is that it replaced the vacuum tube as a basic amplifier with a controlling voltage on the grid if a tube and the base if a transistor. I found out the basic clock circuit in A8 is the crystal with two transistors making a 'feedback' or whatever that is.

Why didn't one of you hardware types tell us that I was wrong about the collector-arrow thingy? I guess it is just too mundane for a hardware type and probably wouldn't be understood by us neophyte hardware types. Any good stuff about basic Atari8 hardware would be nice. I wish someone would write something explaining those flow diagrams which explain the basic architecture of A8. Kendrik could probably use a text file on how the A8 works as well.

3. Cracked Alquist's 'Hodge Podge' and Hsu's 'Math Encounters', two kids/educational programs. 'Math Encounters' runs entirely in two interrupts. A deferred VBI and a timer #2 interrupts. It is weird but pretty nice, just four bytes of main CPU processing in the setup module, all the rest is done in the interrupts. Gives me the idea that eventually I would like to include Tom Hunt's CRC32 in unzip as an interrupt just to speed things up a bit. (Not as weird as J. Harris's 15k DLI kernal in GED tho.)

4. Can't let BASIC 'B' go: To the folks in UK that think I've been smoking that funny stuff when I say I prefer 'B'

version of Atari BASIC. I know I disagree with Tom Hunt
about this. I certainly don't think I know beans compared to
Tom Hunt. But I know he prefers 'C' BASIC and I really don't
think he or anyone else that really uses BASIC (which I
don't think he does that much) is correct in preferring the
'C' version. This is because I have fewer hangups with 'B'
and the few times I've tried 'C', I've always had hangups at
the worst times. I'm not going back to 'C' to try to
document what happens. I've got workarounds for most of 'B's
idiosyncrasies.

(Nitpick mode on)
The Corvus actually came in three sizes, 7meg being the smallest. The
largest was about 20meg I believe.
And the drive could be set to use 180k partitions, not just 90k. They also
had optional backup via a VCR. Used with an Integrater board you could use
any 2.0 clone with it ( MyDos for example. )

Rick Cortese mentioned Bob Woolley had contacted him requesting an article on the 7400 version of SIO2PC for the next AC.

Rick, when you compose that piece, I *do hope* you won't subject readers to a reinvention of the wheel.

SIO2PC was covered pretty thoroughly in the February 1993 issue of AC. That was the issue whose cover theme was "Slave An IBM To Your 8-Bit". It would be nice if you could refer to the excellent reviews by Mike Jewison & Alan Sharkis & use their comments as a point of departure for your piece.

Having already seen one article from the Feb '93 issue reproduced verbatim, it wouldn't go over well to see a rehash of the SIO2PC subject, from scratch, from that same issue, appear yet again. Indications are the management out there doesn't have a clear inventory of all the subjects covered in previous issues (tho they are in possession of the entire stock of back issues). Any new coverage of SIO2PC should focus primarily on the upgrades to the hardware/software since the last publication.

Just my $.02, of course.

Message-ID: <199505080653.AA013285980@relay1.geis.com>
Source record: 91810

Commodore Monitor Input Jacks

Several people have commented on the inconsistent color coding of video inputs on the Commodore monitors.

The color coding on input jacks for ALL the Commodore monitor models is coded for Commodore cables ONLY. You can use an original Commodore cable with the Atari, I've done it, but you have to open the cable up & resolder a few pin connections to do it. Not fun.

I've had, at one time or another, Commodore 1702, 1084, & 1902 monitors. (They're all excellent, but the 1084 is the best. The model # is not an error, it's 1084, not 1804.)

I also have maybe 6 or 8 split-video cables around here. No two of them have the exact same color coding (even a couple that are from the same manufacturer!). And NONE of them match the Commodore inputs. I always have to determine which plug is which by trial & error, then mark the plugs with a fine-point Sharpie marker. The black cable is left unmarked, the others are marked "CV" (composite video), "AUDIO", "LUMA", & "CHROMA" as appropriate. I have never damaged a monitor by connecting the wrong plugs to the inputs, tho some peculiar patterns appeared on the screen.

Jim King mentioned the Super Video upgrades were intended for split-video monitors. It is true that split-video monitors will give you the best results if you do the upgrade. However, composite video is still available from a machine that has been Super-Video upgraded. As I mentioned in the article, if composite video is the only input your monitor has, it probably isn't worth your while to do the upgrade. The CV interface is intrinsically poor, so Super Video improves it little or not at all. Monochrome monitors benefit the most. A Super Vide hack on the 1200XL yields the best color performance. All these hacks, & more, were in the December 1993 AC.

BTW, the S-video connector you see on some TV's & VCR's IS nothing more than split video. Only the geometry of the cable itself is different. The pinout of the cable was described by Bob Woolley in an old issue of the SLCC Journal.

Speaking of the SLCC Journal, I have a whole collection of them I'd like to sell. 1987 thru 1993, about 8 pounds' worth, including all of Bob's famous (& infamous) hacks. $45 to the first taker, postage included (ugh!).

Early bird gets the worm.

3970. XL/XE Power Supplies

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-08 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505080653.AA013635998@relay1.geis.com>
Source record: 91811

Someone (Karl the Ghoul?) mentioned an electronics magazine where an article on XL/XE power supplies was published.

The "electronics magazine" was the May 1986 issue of Modern Electronics. That mag is now called Micro Computer Journal, it's a bimonthly.

How do I know this? I wrote the article. (They paid me $600. That was back when folks took the 8-bits seriously.)

An updated version of the article was published in Current Notes, November 1990, in my "Alchemist" column. See the FAQ list for CN's address to order back issues, it's probably only a couple bucks.

An article on upgrading the Type 1 supply (the white one, alias the "Beauty Queen"), to deliver 45% more power (current), was published in the Nov. & Dec. 1991 issues of Current Notes (the article was serialized). It was titled "Squeezing The Beauty Queen".

The upgrade requires a pair of hard-to-find 1-ohm/5-watt resistors. Not wishing to inconvenience hackers who are wholly dependent on Ripoff Shack for parts, I stocked up on these resistors & made them available to readers for $3 postpaid.

I still have all those resistors around here somewhere. Exactly one person contacted me about them, I just sent them to the guy for free.

Nobody cared, I reckon.

- Ben Poehland

PS- The Good Colonel isn't the only person who ever served as CN's 8-bit Editor. I spent a couple years there myself.

: Anybody else care to share any continuing and current real-world use with
: the Atari 8-bit? Might be kind of neat to discover where else the Atari
: 8-bit technology is quietly being put to use!

This is similar to what John Harris does. Perhaps he will post on the
list to tell us about it (as not all know about what he does).

For those in the Los Angeles area, try flipping onto (well, in my area,
it's 59) for cable. "The Information Access Channel"

It's some kind of test display which may be either an Atari8 or a C=64.
It's hard to tell. I can see what appears to be the larger custom font..
The font is a little messed up on the bottom part. It also looks like
they are feeding the RF to a VCR and then taking the video out because I
can see RF noise. What really looks Atari8ish as opposed to C=64 is the
center part which uses what appears to be the medium size text font, and
that all the text is standard GR.0 style where it is a brightness factor
of the background color rather than the 16-color C=64 thing, plus I see
what appears to be distinct display list blanking lines. Somehow the
display has no horizontal borders (unlike the standard displays). I know
you can widen the display, though.

There are 4 horizontal areas with a double bar going across that are a
different hue in the bars as the background. This appears to be Gr.7 or 7.5.

The colors used, a medium red and a deep green, do not look like any of
the C=64s fixed 16-colors. The C=64 tends to have rather pastel-looking
colors... In the RF noise I can detect what appears to be a telltale
interference pattern (hard to describe).

It has a time display / title display on the bottom.

The software is Infosoft 5000 v.5.3 (c) 1986 INFO/soft technology, Inc.
Seattle.

In 1986, the only 16-bit machine easily used for this task would be an
Amiga 1000, which were very expensive at the time. So there is little
doubt that this is an 8-bit of some kind.

It's just a shame that they did a rather bland piece of software, with
the font glitch on the bottom. But it has been going on for 9 years.

Maybe John Harris could update the software...

If you're REALLY curious I'll try to digitize the screen and post a .GIF.

3972. 256K 600XL w/Alzheimer's

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-08 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505080744.AA033419060@relay1.geis.com>
Source record: 91813

256K 600XL w/Alzheimer's

I'd like to thank all the folks who made suggestions about the sick 256K 600XL I reported. (I had already tried freon spray on the LSI chips, overheating wasn't the problem.)

I replaced ANTIC 3 times, GTIA 3 times, the CPU 3 times, & the LS158 3 times. Sheesh. Nothing worked.

Please don't post any more on this, I've made an executive decision to give up on it.

I'll lay to rest the fears of those who're afraid I'd take the thing out into the back yard & subject it to a shotgun blast. You didn't *really* think I'd do that, did you? I'll merely restore it back to 64K & offer it, along with its 3 brothers, for sale.

I'd like to correct one response which contained the statement that the OS ROM in the 600XL was the same as the one in the 800XL & higher machines. NOT TRUE! Roughly 40% of the 600XLs out there had an OS ROM that was slighly different from the OS in later 600XLs & in 800XLs. I have these two ROMs in my hand right now. The Atari part # on the 600XL OS is CO62024, whereas the 800XL OS is CO61598. Anybody who performs ANY kind of RAM upgrade on a 600XL should also check the OS ROM and upgrade it as well if it's the old one. Virtually none of the various articles on 600XL upgrades even mention this, including the overpriced kit sold by ATV. I discovered it the hard way, when I attempted to run CopyMate on a 64K 600XL with the old ROM. CopyMate crashed the machine upon loading. Replaced the old ROM with the 800XL ROM, it loaded & ran just fine. Put the old ROM back in, it crashed again. 'Nuff said? (Lordy, how much time did I waste on this????)

So, I got four upgraded 600XLs to sell. $45 each including postage in the USA. Outside USA, postage & customs are your headache!

These machines are all in MINT condition, clean, working. All have the following upgrades:

64K RAM upgrade
800XL OS ROM upgrade
Super Video 2.1XL upgrade
Audio Bypass upgrade.
Manuals, power supplies, & RF switchbox included.

Why am I selling these? Despite my affection for their compact size & their nice PBI that can boot up a hard drive, I'm so addicted to big RAMdisks that anthing less than 256K just doesn't work for me. I've got several 800XLs

around here with 256K, 512K & 1-meg RAM, I reckon I'm just plain spoiled.

The case hardware modification on these (for the video port) was done so cleanly that most people would think it came that way from the factory. Not your usual butcher job here. Super Video for the 600XL is extremely tedious due to the cramped space inside. I will not do any more of these, thank goodness! Composite video output is available in these units, but as mentioned in my post on the Commodore monitors, it's quality is just so-so. Best results are obtained from mono monitors or split-video color monitors.

These 600XLs are fully equivalent to a stock 64K 800XL, only they're in a 30% smaller package & their video performance is about 12,000 times better than a stock 800XL. Everything else, including keyboard & cosmetics, is exactly identical to an 800XL.

- Ben Poehland
b.poehland@genie.geis.com

PS- Package deal: the whole lot for $100, including detailed docs on the mods.

From: bosco@host.yab.com
Message-ID: <3ol9ka$jb7@news.yab.com>
Source record: 91816

In some message Ben Pohland wrote:

(A long diatribe where he relates the recent troubles that AC magazine is having with his wish to discontinue using an 8-bit as a serious computer)

PULEEESE! We put up with your ramblings in the last issue (Unicorn) of AC and now you do it here? At least this time it relates with problems with the 8-bit. I don't know where you get off relating YOUR use with a computer with SOMEONE ELSE'S problems with the same computer base.

I had a friend who got into the C=64. Joined their club, went the whole 10 yards. Later he got into an arguement with a club member. He then sold the C=64, quit the club, and said statements such as "Damn Commodores" and "They are all idiots", just because of the one arguement. Although your sentiments aren't as extreme, that is what I'm "reading between the lines".

If you want to quit the 8-bit, more power to you. If you continue, ditto. But don't judge YOUR actions by what a few OTHERS do. When I quit this "hobby", I won't be writing an overly long diatribe as to why I'm doing so. I will just quietly go away.

There are several people I've run across who use an 8-bit and they never get onto the FIDO, PRO or CSA8 and they are very happy with the machine because of what the machine can do, not because of what others say about it.

> somewhere along the way...

Notably when it seems they canceled the 65 only minutes after
introduction! Then again, the 1090 would seem to be an XL product, in the
old livery, so perhaps this and a perceived lack of demand did it in.

> Probably because they didn't want to have to release software on both
> 3.5" and 5.25". Look at the mess in the PC world, with some machines

Yes, I should have read the message a little more, I noted the 3.5
reference later.

Thanks for the note!

Maury

>Chris, I didn't read it all, but I do know how addition works in computers
>(and about the roll-over and stuff), and I'm curious.. using the ADC operation
,
>can you easily do addition/subtraction of LARGER-THAN-TWO-BYTE values (and
>do it proportionally quickly... ie, just keep doing the same commands over
>and over for how many bytes you're using?)

Sure, Bill, you can do N-byte addition and subtraction just the same as
you'd do 2-byte! The code to add a 2-byte number X to a 2-byte number Y,
yielding a 2-byte number Z, would be:

```
CLC ; Prevent carry into least-significant bit
LDA X ; \
ADC Y ; > Add 1st byte...
STA Z ; /
LDA X+1 ; \
ADC Y+1 ; > Add 2nd byte. (done!)
STA Z+1 ; /
```

If you wanted to extend this code to add the N-byte number X to the N-byte
number Y, yielding N-byte number Z, you'd just code additional LDA/ADC/STA
sequences until you'd added N bytes! Like so:

```
. .
. .
. .
LDA X+2 ; \
ADC Y+2 ; > Add 3rd byte...
STA Z+2 ; /
LDA X+3 ; \
ADC Y+3 ; > Add 4th byte...
STA Z+3 ; /
. .
. .
. .
LDA X+(N-1) ; \
ADC Y+(N-1) ; > Add Nth byte. (done!)
STA Z+(N-1) ; /
```

The way I've shown it, of course, it's hard-coded for a fixed value of N.
Wrapping this up in a loop to handle arbitrary N is left as an exercise
for you, the reader! :-)

>And why the hell wasn't FP put in Action! !? <:^[

Maybe they figured it was already there in the ROMs and you could get at it on your own if you wanted to. Someone else has already pointed out the REAL.ACT code on the Action! Toolkit disk; I agree that it's an "ugly" interface, but then, it's no worse than having to call a different Print???() routine for every data type, with and without end-of-line characters! Sheesh!

Hi.

Each DOS program should be terminated by RTS, and _for_me_ it works well, too. JMP (DOSVEC) (not JMP(DOSINI)!!!) you can use, if your program deletes the stack, as Turbo BASIC XL, for example. Both methods are good, but RTS is more "elegant".

However, the SpartaDOS X can hang up, if you terminate program by RTS. But there isn't a problem in *terminating* but in *starting*. Each DOS program (i.e. last binary segment) should be started using *** RUNAD *** vector, not by *** INITAD *** !!!! Otherwise, the SpartaDOS hangs up.

Bye

When I lived in Orlando, our cable system has a SportsTracker channel which showed scores all day. One day it sat at the READY prompt most of the day. :) The Atari dealer in Orlando (John Morrison) says that many people use XL/XE's in Apt. complexes and such for an on-premesis info channel, and then a bunch turn up in need of repair after a good thunder storm. He usually steers them away from the XE and toward the 800XL because they seem to hold up much better.

>Likely that really doesn't help much, but I've noticed that Mike G. (of
>SpartaDOS fame) tended to use the bit instruction a lot...

If I may... I believe what may confuse the ML newbie, is that the "des-
cription" speaks first of performing a "logical AND," then of the "result of
(a) comparison." I'll bet you a cookie that our original poster is reading
that and asking, "WHAT comparison? It was an AND, not a CMP!"

What, he wonders, does a "logical AND" have to do with a "comparison?" An
AND is a bitwise/logical/mathematical "operation" that combines the bits of
the accumulator with those of an external operand in a certain way to yield
a result, but a comparison is... well, he doesn't know quite WHAT it is,
but it's probably "some kind of test."

The trick is that a comparison ISN'T "some kind of test" at ALL. The
"test" part of a comparison occurs in the "branch" instruction that usually
FOLLOWS a comparison! A "BEQ" (branch equal) instruction, for instance,
causes a branch "if the result of the last calculation was zero," or, to
be more specific, "if the Z condition-code flag is SET!" A "comparison"
operation REALLY consists of the "set-up phase," if you will: placing the
condition-code flags into a meaningful state that reflects some useful or
interesting property of the value in the accumulator.

If the instruction executed before BEQ was CMP, then we say that BEQ causes
a branch "if the values compared were equal." If the prior instruction was
ADC or SBC, then BEQ is said to cause a branch "if the result of the
calculation was 0." However, these two (or three) cases are IDENTICAL:
in EACH case, a mathematical operation is performed and its result affects
the state of the condition-code flags. The ONLY difference is that CMP
"doesn't store" its result! "CMP #3" is almost identical in function to
"SBC #3" (here my knowledge breaks down just slightly. Does anyone know
whether CMP considers the prior state of the carry flag, as does SBC?),
except for storage of the result.

So how does this relate to the BIT instruction? Simple. The BIT instruction exists in the same relation to the AND instruction, as CMP does to SBC. If you execute an AND (or SBC) instruction, an operation is performed on the accumulator with an external operand, affecting the condition-code flags and storing the result in the accumulator. If you execute a BIT (or CMP) instruction, the _same_ operation takes place, and affects the condition codes in the _same_ way -- but the result is not stored. PERIOD.

The only difference between BIT/AND and SBC/CMP is that SBC/CMP consider the accumulator's contents as an integer numeric value, whereas BIT/AND consider it as a pattern of bits. ANDing one bit-pattern with another yields a result with 0 bits wherever there was a 0 bit in EITHER operand, and 1 bits only where there was a 1 in BOTH operands. An AND, which stores its result, allows you to use that result in further calculations, or to further test individual, or different, bits. A BIT, which DOESN'T store its result, can still tell you whether there were NO bits set in the result (it was "all 0 bits," or "zero," i.e. the Z condition-code flag is set), or whether bit 7 was set (bit 7 = the sign bit, i.e. the N condition-code flag is set). Sometimes that's enough information, and THAT's where the BIT instruction comes in handy.

Hope this helps.

>in a carry and hence the flag is unaffected?

The short answer is, "yes, the carry flag IS reset to zero after the second addition."

The long answer goes on to say that, "it wouldn't be of much use if it DIDN'T." 6502 instructions that "affect the condition codes," ALWAYS affect the condition codes. ADC, for one, has no "memory" of what has or has not occurred in previous ADC executions in the instruction stream (this is, in fact, precisely what the condition codes provide: "memory" from one instruction to the next!); under such circumstances, the ONLY behavior that makes sense is for ADC to set OR CLEAR the C flag EVERY time. Ditto for all other instructions.

(Gee, I seem to have a good start on a 6502 programming book, myself! :-))

Ben; rigth now any critisizm of AC will seem out of place. This isn't like Antic where the publisher enticed people to send in long term subscriptions then started a PC mag & folded Antic. There is a certain amount of guilt by association when you mention them in the same sentence. It may be a true statement, but saying something like Hitler and Renoir were both painters causes people to jump to the conclusion there is something beyond painting you're trying to imply the two have in common. I know you're a scientist, but just because a statemnet is logically & factually correct does not mean it will be percieved as such by the general public.
I'm sure there well be more critisisms to come. For instance, if I get off my butt & get a sio2pc article to AC, everyone in this sig will have seen the info before. What should I do? Stop posting any hacks I do to the sig or not send an article because the info could be found somewhere else? With Bob at the helm, AC will most likely become very hardware orientated, not because he wants it that way, because that is what he does. When AC was under your wing & people complained about content I usually asked for specifics. Turned out about 1/2 the people complained there were too many hardware articles & the other 1/2 complained there were too many aplication articles. Not fair, but it still happened. I took it as you did a good job hitting the middle of the road since you managed to offend people in both camps.
BTW: Alza in CA had a number of job openings at about the senior chemist level last time I went by to visit.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <138332@cup.portal.com>
Source record: 91826

Don't worry about the SIO2PC article. The reason I talked about 'my hack'
was because: In response to several of our foreign participants in the
sig that couldn't get the MAX232 chip, I did two functionally equivalent
circuits using either a 4049 <for non modified 1200xl's & everything else>
and 7400 for people who said they had trouble finding anything but 74xx
parts. I'll give you *ONE* free shot at me, if you think the article is
without merit or of no general use to readers of AC, just say the word
& I'll do something else. There's been at least a 1/2 dozen people on
the net that have requested the schematic & I believe it was the general
interest in the topic that caused Bob to request the info, but if you don't
think it has a place, fine. There's a lot of other topics I can cover.
Rick
BTW: Jewison came in the sig & flamed us, I would have like to have had
his input in the sig since he is very knowlegable about the 8 bit, but
apparently he's a weenie an a butt with his hit & run tactics. Quite
immature & left the impression of sour grapes. He owes us all an
apology & using him as an example of someone who's already 'done' the
sio2pc thing would probably be regarded as an oxymoron in this sig.
I seriously doubt if there will be many requests for reprints of his
article comming from this sig now that we know he wrote one.
Rick

I remember it. I thought it was just a double sided drive though?

> No matter what part of Atari8 history you touch on, it is laced with
> decision making misakes on the part of Atari. Some didn't seem like
> mistakes at the time (like this) but were bad in the longrun. Other
> stuff (like how Tramiel handled the 8-bit) was more damaging.

True, true. Things were looking GREAT for a time with the XL lineup, all the items being mentioned here are perfect examples. Suddenly the whole Atari catalog looked great, well "stocked" and full featured. Devices like the 1090 and AtariLab would have made it all look a lot more serious.

Well then in come the Tramiel's, and presto, all gone.

Still, I think one of the single most damaging things was Atari Basic. It was a brilliant bit of design in terms of syntax, the language just made more sense than any of the MS clones, like LIST 10,50 as opposed to LIST 10-50, what's that, LIST -40?. However, the lack of REAL string support (and integers to a lesser degree) and it's abysmal speed put it constantly at the bottom of every benchmark in the mags like Creative Computing.

After I got rid of my 8-bit and got a ST (duh), I remember my Atari-wonderkind friend Oliver showing me SpartaDOS and a replacement BASIC (from Happy Computing). Even interpreted the basic was many many times faster, and was completely full featured.

And then there's that whole 2-line lockup issue!

Hi everyone,

I'm new to the 8-bit and have written a small program to run through several displays. The problem is that after several minutes, the colors start changing until I press a key. I assume that Atari Basic has some sort of built in screen saver. Is there a way to turn this feature off? I would guess there is a memory address that could be poked to do this.

Thank in advance for any help

Jay

3993. Thunder Child Lives!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-09 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505092248.AA206939723@relay1.geis.com>
Source record: 91834

Thunder Child Lives!!!!

Among the responses I received to my post "256K 600XL w/Alzheimer's", there was someone who suggested my 6502 CPU was the culprit. Whoever that was, please identify yourself to the newsgroup so you may be congratulated.

YOU WERE RIGHT!!! It *was* the CPU after all!!! Here I am beating myself up for maybe screwing up the 256K RAM upgrade, & doubting the documentation written by Jeff Popp, when it was the CPU all along.

I intially replaced GTIA, ANTIC, & the CPU 3 times, & always got a failure, so I gave up on the whole idea of ever having a 256K 600XL. Today I was going to dismember the upgrade & downgrade the machine to 64K, but I decided to give it one last try. I decided to start with the CPU first. I went pawing thru my collection of custom Atari LSI's & noticed something: all the CPU replacement chips I had tried earlier were Synertek chips. I had some NCR chips & some Rockwells in there too, so on a lark I decided to try a CPU made by one of the other manufacturers. MAMA MIA! When I plugged in the NCR & Rockwell chips, everything ran fine. Put back in the same Synertek chips I tried earlier, they ALL failed! I trashed all 3 Synerteks immediately!

I went back into my stock of CPUs & found I had 3 Rockwells, 2 NCR's & 5 more Synerteks. I tested the entire lot of them right then & there, using this simple counting routine:

```
1 FOR I=1 TO 10000:?"[5 spaces]";I:NEXT I: GOTO 1
```

I was amazed how hot the CPUs became when this simple little prog is running. I let the program run for at least 30 minutes on each chip (took me the whole darn afternoon!). But it was worth it. All the Rockwell & NCR chips passed. But, of my remaining 5 Synerteks, one of those failed! So, out of a total of 9 Synertek 6502C CPU's, 4 of them were bad! Unbelievable! You can recognize the Synertek logo easy: it's an inverse capital "S". The company went belly-up in the mid-eighties, I see why!

The good news here is that Jeff Popp's 256K 600XL RAM upgrade DOES WORK. His written instructions are a nightmare, but the information is essentially correct. The upgrade kit, including Popp's instructions, are available from Best Electronics. Also, the manner in which I implemented the upgrade, by using a modified RAMbo board, is do-able & eliminates most of the rat's-nest wiring on the motherboard. (Pity no one will ever bother selling modified RAMbo cards for this upgrade. I must say it is one helluva nasty hack, tho. I won't do any more like this & am still offering my remaining three 64K 600XLs for sale.

But I'm gonna keep this one unit that's now working. Such a cute little thing, thunder in a pint-sized package. I call it "Thunder Child". (Can anybody guess where I got that name? Heh. Two gold stars & a dogbone to whomever gets it right.)

I just booted up my main system with Thunder Child, what a kick to see this little computer driving 4 1.44-meg PBI floppies, 2 sio floppies, & a 44-meg SyQuest hard drive, all the while pumping out crisp monitor-qulity video while giving me enough room to run 128K XE software plus a nice 128K RAMdisk for downloading email & storing temporary files. In half the space of an 800XL! This is the 600XL Atari should have made.

I'll be using Thunder Child as my main computer for awhile. As I gain more experience using it with different programs, I'll report any bugs I encounter to the newsgroup. What a cute little computer, I love it.

And to that fellow who suggested the bad CPU, I thank you a thousand times!

- Ben Poehland

Ben has many valid arguments.

Although I'm simply glad there exists an 8bit magazine, I'm also flustered at the fact that I paid $25.00 for something which I doubt I'll ever get.

I mean, I can get a one year sub. (12 issues) of Dragon magazine for $25.00 and its glossy, has a comic strip and the works.

The least I expect is a TIMELY magazine -- content can always be improved upon.

Is Senior Technical Associate close enough (jr. engineer)? Spent over 8 years there starting in 1977 in Consumer and Computer divisions...Ok also a short stint in Pinball division.

Doug's credit for Star Raiders has
>only been known to the average Atarian through the grapevine. I haven't

>without a fight.
>

>
>
Is that what I said? I think I said the "late great" Jay Miner was not at Atari when the 400/800 was released. He was certainly a part of the design effort and philosophy, but maybe not as much as you might think.

Jay was much more of the system "father" of the Amiga chipset than the 400/800 I believe. I never worked with him at Atari, but did get the chance to meet him (real nice guy!) when Atari started working with Amiga in late 83.

Your apology is accepted in advance!

3997. Cooltris 2 beta? Any try it?

3998. 1050 Mech differences?

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-09 00:00:00 UTC
From: heller@blue.crayola.cse.psu.edu
Message-ID: <3on1ti$h56@psuvax1.cse.psu.edu>
Source record: 91839

here is a little story:

I have 2 dead 1050's. I have 2 working 1050's (1 duplicator, 1 US)
The dead ones are stock. Each pair has a WorldStorage Drive, and a
Tandon Drive.

I pulled the good Tandon mech from my working set and put it in the
dead drives. After some tweaking of the main board ala 1050 Field notes...
I got the 1 drive to function perfectly... even ran the 1050 diagnostics
and burn in.

Now, I take this same mech and put it in the other dead drive. This
mother board sports the EPROM and WorldStorage mech...(The one I fixed
was a Tandon mother board)...

First pass says speed is way off... Fix that.. now it tells me
track zero is way off. Hmm... I do some looking in the 1050 book...
Q5 or U13 I check both..(I know the sensor is good, otherwise it
would not have worked on my original unit and the 1 I fixed)..
I notice what I think to be an error in the Field books about
the collector of Q5 being 5 volts when it ISNT track zero and Zero when
it is track 0. I measured the exact opposite... on all my drives...
of course...maybe the silkscreen is wrong... anyways...)

This stupid mech wont work with this WST board!!..so..I pulled my good
WST mech and slapped it in. Speed IS WAYYYY off...I fix that...
run diagnostics... EVERYTHING works.

Okay...
Questions:
Why doesn't a Tandon mech work on a WST motherboard?
Um..how can ATV say their Tandon mechs work on all 1050's?
(Does a tandon mech work..but I must manually adjust the track zero
sensor?)

Where can I get WST mechs? Where can I get WST presure pads?
(My WST mech has a tandon pad held in by a piece of paper...
not very RIGHT.)

Thanks to anyone who can lend help...

Andrew "The Ghoull" Heller

Just graduated from 5 years of Computer Engineering.

4000. Portfolio Ports

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-09 00:00:00 UTC
From: chuck@utdallas.edu
Message-ID: <3on1d8$oj@utdallas.edu>
Source record: 91841

Please forgive this post, but it does relate since the Portfolio is, in fact, an Atari.

Anyway, I'm trying to find a source for the connector for the bus port on the side of the portfolio. A loose description would be a miniature centronics port...a raised center surrounded by 2 rows of pins. Anyway, if anyone knows of a source for this connector, please drop me a note at the above address of chuck@sdf.saomai.org.
THANKS!
-- Chuck Knight

Over the last 2 years I've helped another man build up a working Atari ST system. Right now he's got a upgraded 520ST [1 meg] SS/DD disk drive and color monitor. He has picked up a mouse and a 2400 modem. What he needs now is a Hard Drive. As I will be buying it for him, and I'm on a fixed income [V.A.Dis.], I am looking for something like a old SH204 or any scsi drive between 20 to 50+ megs. Plus it has to be low cost too. Please reply if you have such a thing.

: Anybody know of any warps in 8 bit Crystal Castles?

Here you are. This is from a list our club maintains...

CRYSTAL CASTLES

On each level of the game (not necessarily each maze), there is a
"window" where you can skip ahead two levels. On the first board, it is
on the left hand side. Press the button and warp ahead two levels.

Hope this helps.

>That reminds me... does anyone out there know what the overflow (V) flag is
>for in relation to ADC and SBC??? Something to do with signed multi-byte
>addition but that's all I have ever found out.

The V flag is only important if you are interested in using 8bit signed
arithmetic. Otherwise ignore it.

The C (or carry) flag allows you to perform multi-byte adds/subtractions.

>>And I still don't know what the instruction BIT does.

BIT perform a logical AND with the operand and sets the Z (zero) flag if the
result is zero; else it's reset.

It also copies bit7 of the operand into the N (or sign) flag and bit6 into the
V flag. It's no coincidence that the N and V flags are bits 7 and 6 of the
processor status register.

Note that CMP is a subset of SBC. CMP assumes Carry reset and does not store
the result. CMP however does not affect the V flag.

>
>Sheesh!

Heh, isn't Unix great? :-)

But it wasn't for nothing, it was a VALUABLE LEARNING EXPERIENCE.
Remember that. :-)

I just did a little test (using HPUX; I'll try Linux later), and made
a file that looks like this in emacs:
this file contains\233Atari EOL characters\233\233Enjoy.\233

With no newline at the end, and the "\233" is really one character,
decimal 155 (octal 233).

The command to do the trick is:
tr \\233 \\012 < atarifilename

Which gave me:
this file contains
Atari EOL characters

Enjoy.

YMMV - different versions of tr have different idiosyncracies.

Quotes could be used instead of the extra backslashes:
tr '\233' '\012' < atarifilename

Also look at the sed command.

That's the end of today's Unix lesson. :-)

From: khaley@nova.gmi.edu
Message-ID: <khaley.800119002@gmi.edu>
Source record: 91760

Argh!!! My quest to find Phantasie I is not bearing fruit. Several calls to vendors reveal that this title has been long gone out of backstocks and nobody knows where I can get one. I long to return to Gelnor, but have no way of getting there. :-(

So, does anyone here know of where I could go to get Phantasie? Or, does anyone have a copy of Phantasie (box, original disks, and manual) that they are willing to sell? If so, name your price, or if you would rather trade it for Flight Simulator II, let me know.

Thanks for any information you may be able to contribute in my search.

/Kevin

4008. Oh dear, Ben is upset!

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-10 00:00:00 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <D99C043CDF@east-01.novell.leeds.ac.uk>
Source record: 91761

To quote a recent posting...

"Jan/Feb AC: Some Concerns

A British reader who is apparently satisfied with the present offering, but who never subscribed to the "old" AC, trashed the entire previous history of the mag's record on the basis of having seen one article from a previous issue that he didn't like. The "old" AC never published an article on "Sticky Labels", so I must challenge the legitimacy of that comparison. My suggestion is for that person to buy all the back issues (they're available from the present Editors), & THEN make a comparison between the present & past performance of the publication. If you aren't willing to put your money where your mouth is, then keep your mouth shut."

I think this is directed at me Richard Gore, I'm British and it sounds like something I said. However has has happened a lot lately I seem to have got on somebody's back and they have bitten back with a load of c**p. Also I won't hide behind the news-group, post your replies directly to me if you want to, my e-mail address is chmrig@leeds.ac.uk
As for the above quote, well I don't think I said I was completely satisfied, what I said was give the new leadership a chance, yeah they made a cock up or two, but nobody is perfect and they have had their fair share of troubles. While I'm on the issue of new leadership, Ben if you remember another UK Atarian offered to take over running AC on two different occasions and you told him to 'take a running jump', I know the guy and he found your comments at the time down right insulting, so just think on, its essentially you who decided who should continue with the AC idea.
I have now got most of the old AC issues, and my comments do hold true. The saga of the AC database, doesn't that twaddle on about sticky labels. I am not alone in my thinking, I know of at least one other Uk user who thought the old ACs were c**p and he did subscribe!
As for me putting my money where my mouth is, I think I have done that, when the old AC was running I was a student and simply could not afford to subscribe, when I graduated (with a degree in Chemistry!) and found employment I put my money where my mouth is and subscribed to the AC that was running at the time as well as buying a couple of copies of the old AC, so I KNOW I have earned and paid for the right to make any criticisms I want to.

I conclude this message by thanking you Ben for not being petty, its great to see somebody who calls himself the 8-bit Alchemist thinking of quitting the Atari 8-bits, now thats dedication for you!!!!!

Remember post replies to me or the news group, I can cope with both!
Finally sorry for the petty nature of this posting, but I can sink as

low as any body else, if pushed into it!

Richard Gore

Both Ice-T 1.1 and 2.0 (the 128K version), use the INIT vector. 2.0 uses it quite heavily, to stick data loaded into $4000-$8000 into banked memory, then load information into the next bank, moving it into banked memory, etc.

Does this cause compatibility problems with SD?

Just wanted to say something about hat Keycode Getter..

What a useless program!!

The way to check keycodes goes like this:

$79 is the keycode-table pointer.

If there's a zero there stuff a value of $FE in both $79 and $7A (this is for the 800).

From then on:

```
ldy 764 ; get keycode
lda ($79),y ; get atascii value for that key
```

And it's as simple as that! In case the value of 764 is higher than or equal to 192, it's a ctrl-shift combination. The program should reset the two most significant bits, and do the LDA then (telling the user something like Ctrl-Shift-A).

What is the use of Keycode Getter?

4021. 6502 Overflow flag

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-10 00:00:00 UTC
From: Jeff.Thomas@balmybeach.gryn.org
Message-ID: <0f7_9505120740@tor250.org>

S > in relation to the ADC, SBC 6502 instructions? All I've been able
S > to dig up is that it is something to do with multi-byte signed
S > arithmetic. Is this true or does no-one know?

You've got it right, the overflow flag is used for signed multibyte arithmatic

where the result is greater than 128.

The reason for it being there is that the 8th bit is used for the sign
therefore only a value upto 128 can be represented in a single byte.
The overflow means that the the math operation has "overflowed" into the
sign bit.

So say you do an ADC in which the contents of a location are added to the
number in the accumulator, and the result is greater that 128, then the
overflow flag would be set. It's almost like the overflow flag is acting as
the 8th bit. It works in a similar way to the carry flag.

Hope this helps...

> something in the Binary header is causing it?

Is the code you're binary loading executable, or do you need to run it using a USR call? If it needs a USR call then you'll need to find out what address the program resides at when it's loaded. My guess is that you need to use a USR call.

You can make a binary file autorun using DOS. You use the binary save option from DOS. You will have to change the INIT and RUN address in the file.

So in a sense yes the header info is causing it.

$.02, anyone is planning on doing some real high horse power projects with JS ports I want to mention the Motorola 3010. This is a 6 pin optoisolator that can drive a triac. It's been a while since I did it, but as I recall it only took a small signal PNP transistor & current limited resistor to drive the LED stage & one 180 Ohm resistor in the output to drive the triac. This set-up easily handled 120-150 Watt flood lights. <Whoops, limiting above>. The parts are all available at Radio Shack.

I always thought the lack of real string support was great. In Atari
basic you had a lot more freedom of what you could do with strings. The
only main was concatenating, but it wasn't that hard.

I really liked the ability to have a string as big as you had memory for
it!!

4029. User Group Meeting Notice

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-10 00:00:00 UTC
From: nickd@vpnet.chi.il.us
Message-ID: <1995May10.040717.6716@vpnet.chi.il.us>
Source record: 91843
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

The Suburban Chicago ATarians (SCAT) user group will hold its May meeting on Tues. May 16 at 7:30 PM at the College of DuPage, Room K 157 (the K building is on the south side of 22nd St. just west of Lambert Rd., in Glen Ellyn [IL]). The scheduled demo is: Various demo (and ?) programs on SCAT's 'new' demo machine, a 1040 STe, courtesy of our Vice President, Mark Biallas.

Also, I have something I videotaped off of the Discovery Channel that I'm sure will interest Atari/videogame fans (it's only 5 or 10 minutes long). I believe that our intrepid 8-bit Librarian, Joe Chiko, has an 8-bit demo too, with the help of (some of) his children (as I recall). "Surprise" demos are always welcome, too, especially now that we have the STe.

Everyone is welcome to attend. (Especially anyone who is thinking of joining SCAT :-) Feel free to bring your family.

For more information, send me E-Mail at one of the addresses below. [If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work (at all sites) now. Say, if you're travelling to the Chicago area and will be free that evening, feel free to stop by!]

Nick DiMasi, SCAT President

I must be tired.. I guess the real name for it should be "eol2nl" as it's a Unix program..

Anyway, I know it's been done before, but I didn't want to hassle looking for it, etc. (I think "TT" for the PC may have been written in C, thus portable to Unix) besides I was getting QUITE rusty at C so I needed a bit of practice.

Anyway, it converts ATASCII texts (w/ EOLs) into Unix texts (w/ NLs)

It IS NLs, isn't it? (New Line's) Or is NL on the Mac? If so, what is it called on Unix.. If not, what are the EOLish chars. on the Mac called? :)

It's "eol2cr.zip" (includes .c source and .doc file) and there's a blurb ("eol2cr.txt") as well...

it's at UMich archives (ftp atari.archive.umich.edu cd atari/8bit)

As of now in "New" directory.. should be moved soon I hope (and a link to it will be in "Newitems" directory)

You have to keep poking 77 with 0 to keep the "attract mode" suppressed.
77 counts up to 128 slowly and at that point the mode activates.

N.B. The Attract mode is an O.S. feature and doesn't just occur in Basic.

I just checked my online reference card on peek & pokes,
available through http://www.cis.ohio-state.edu/~funk/Atari/Ref, and
got this:

PEEK/POKE ADDRESSES FREQUENTLY USED (multi-byte values are LSB-MSB)

Label	Decimal	Hex	Description
RTCLOCK	18-20	12-14	24-bit TV frame counter/real-time clock

ATTRACT 77 4D 0 to suppress attract mode, 128 to start;
incremented every time loc. 19 increments

So to disable the color changes, POKE 77,0.

It's actually in the Operating System. It's handled by Vertical Blank Interrupts and a timer counter...

Just do a POKE 77,0 on occassion to keep it off.

Poke 77,128 to turn it on right away .. a key will of course turn it off again..

Inotherwords, if you had a thing which did:

```
FOR A=1 TO 50000:NEXT A : REM long pause between displays
POKE 77,0 : REM this would be useful to keep saver off
```

Oh yeah, it's called "Attract Mode" - it "attracts" the user to the fact that they haven't pressed a key.. or something..

On a side note - why the HELL are screen-savers controlled by keyboard/mouse input? (ie, on all systems with them - Atari 8bit, MS-Windows, and the savers for Windows/Mac (like After-Dark)) !?!?!?!?!

I mean, can't they tell when the screen is being changed!? Sheesh! :)

Nah, screens are output-only. And the program doesn't always have
complete control over whether the screen is changing.

With modern high-frequency monitors, though, so-called screen savers
really don't do anything but entertain, cover up any real work, and
constantly waste CPU cycles. I've never seen a VGA monitor with burn-in.

kendrick@zippy.sonoma.edu (William Kendrick) writes:

>Oh yeah, it's called "Attract Mode" - it "attracts" the user to the fact
>that they haven't pressed a key.. or something..

It's a throw-back from the Atari Arcade Games days. In a lineup against other brands, the Atari would be the one most noticed because of the color rotations... More likely to get a quarter dropped into the coin slot if it's noticed from across the room.

>On a side note - why the HELL are screen-savers controlled by keyboard/mouse
>input? (ie, on all systems with them - Atari 8bit, MS-Windows, and the
>savers for Windows/Mac (like After-Dark)) !?!?!?!?!
>I mean, can't they tell when the screen is being changed!? Sheesh! :)

It's quite possible that people wouldn't want the screen saver deactivated by simple screen activity. I have a corner clock that would perpetually diable screen saving... Thanks to my experience with ATTRACT MODE, I _MUCH_ prefer a screen saver that rotates the color registers rather than the ones that play cutesy graphics movies. I want to _SEE_ what's going on with the programs that are running, as opposed to slowing down the entire system with some useless graphic motion.

4041. Re: XL speed up

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-11 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <138458@cup.portal.com>
Source record: 91705

Bastian; I have limited experience, all of it bad<grin>. I sat around
on several days substituting different clock sources for the 1.79 MHz
system clock. You lose video immediately when you speed up the clock
if you don't add a pulse stretcher to the composite sync pin of GTIA.
I tried a few slower speeds just to see what the range of values I
could get. It seems like the system will run anywhere between about
1.6 to 2.1 MHz before it fails to boot. I just used two gates of a
74xx series inverter with a variable resistor, capacitor, & diode
to build the pulse stretcher, but I believe something like a 555
timer or 4528<#?> would have worked even better. The first thing you
notice is without the 1.79 MHz crystal you immediately lose all color
info. It's bad, but you still have lum control. The other thing is
the display gets shifted to the left. At the higher clock speeds it's
shifted so far to the left you can't see the first couple of characters
& 'snow' starts to appear on the right hand side of the screen. I was
originally thinking that I could switch to the wide playfield modes
for stuff like 80 column 5 bit wide characters, but I would have had
to add a shift register at this stage to get the display back on the
screen. In my original design, which never worked for some reason, I
tried using the Antic !HALT line to switch the two clocks. Didn't bother
looking at why it failed, but when I pulled the line going to the !HALT
signal & just touched it to either +5V or 0V, the thing switched
speeds on the fly like a champ. I gave that one away, so we'll never know.
There was one other claim to higher clock speeds made. Someone from
Germany claimed they had all the switching logic built into a PAL or
something like that. They also said they had a 65816 in there that would
continue running if it was operating in an address range >64k. I think
people are a little skeptical of those claims. Not that it couldn't be
done, just that there were request for plans & offers to buy that weren't
responded to. It could have been somewhere other then Germany, but there's
a lot of competetent hackers there & that made the post believable for a
time. Whoops! looks like I'm really an incompetent speller<g>.
As far as the serial buss goes, it derives it's rate from the system
clock & a programmable register in a manner analogous to the 8250/16450
with their 1.84 clocks. You should be able to do something like a divide
by 16 for rates around 115k baud, but as far as I know, most of the high
speed disk I/O stops at less then 60k baud.
Rick

4042. Will trade VOICE MASTER Jr. for any of this soft:

It's a good point, but I remember the price differential when they shipped. An Apple HD cost about 3 to 4 TIMES what the Atari drive did. And Atari came out in about 1978 (9, whatever), before the rest of the market had HD's at all. By that time they were locked in.

Maury

Yes, but doesn't the Apple II have double density? If cost was the
problem, why did EVERY other 8-bit machine have double density drives?

In fact, I know of no historical home computer aside from the Atari8 that
used single sided single density disks. Maybe they were used in the
early 70s or something but by the mid 70s everyone had switched over.

I know at least one book somewhere does for a fact state that Attract Mode is meant for a screensaver.

Not that it is mutually exclusive, it could be thought of an "alert" or what have you, but it was indeed meant to save screens from burnin.

The 2600 has it too, but only if you program it in (which most early games have).

I once asked the Amigoids if there was something the same for the Amy, but no response. I guess people like flashier screensavers these days.

: : as split video, aka Y/C video, aka chroma/luma video.

: Huh? S-video uses one cable for video. Split luma/chroma uses two!
: How can this be?

Yep, S-Video is basically the old split composite video with its
separated luma and chroma signals made into a a 4-pin DIN connector.

Even the Macintosh ADB cables can be used as S-Video cables.

I am currently running a modified S-Video cable from the back of my
Jaguar to the back of my Commodore 1702 monitor where the split
luma/chroma signal inputs are located. Gives an excellent picture. Only
thing better is the analog RGB inputs on my Commodore 1084 monitor!

S-Video cable was modified by bringing out the chroma/luma lines and
wedding them to an RCA plug.

Thank You, like I said, I've fixed several XL's and XE's with the same
problem. I never did notice what brand the CPU's were, tho, I'll be on the lookout
for them now. Come to thing of it, one of them was after I'd installed a Newell
1 Meg upgrade. It ran for about a week and began giving intermittant problem
whille running a BBS (WRAP 10 in St Paul, Mn.)
Along this same line, is there one place that has all or most of the
Atari 8 Bit upgrades? Some of the ones I've done I took the liberty of re-writing,
adding a point-to-point wiring chart and in a more logical order. Use to have to do
this all the time at work when working on Prototype machines so each PCA had
the exact same re-work, wire for wire and part for part.

Rich Mier

For computers, yeah. For printers, which ASCII was invented for
(well, teletypes), and maybe even for dumb terminals, the CR/LF combo
makes a little more sense.

But I do kinda like the way the whole combo looks on an Atari8 BBS
that give a multiline welcome before finding out which EOL you use.
On the Atari it looks like a sideways flag hanging off the end of each
line, and on the PC you get a cent sign on each line.

There's very little "incompatibilities" nowadays.

We do 14.4k modems.
We do SCSI and IDE hard drives.
We can read/write DOS disks.
We can print on, say, HP 500 printers for example.
We can view GIFs in 2, 8, 4, 16, 64, 256 or 4096 colors/shades.
(Hopefully JPG soon, too)
We can listen to MODs (either raw, if they're not too big, or converted
with one of I believe 3 or more different conversion programs/formats)
We can use PC's as though they were disk drives and printers
We can use PC's as though they were actual Atari's (emulator), and soon
I believe Mac as well! (Is Emplant for the Amiga still going to do Atari?)

There's still quite a bit we can't do, of course, and still quite a lot of
file formats we can't easily read (I don't think we can do .MID, and I know
we can't do JPeG, MPeG, DL, FLIck, ANiM and quite a few other graphics and
animation formats used these days... also, a lot of word processor formats
and rich-text elude us as well <:^( )

Anyway... lllater!

Summary of Atari 8-bit's an emulated 8-bit Atari's:

Atari 8-bit computers were produced between 1979 and 1987. The
major models released were the:

400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
```

1200XL - 64K, 1200XL OS, GTIA graphics
600XL - 16K, XL OS, GTIA graphics
800XL - 64K, XL OS, GTIA graphics
65XE - 64K, XL OS, GTIA graphics
130XE - 128K, XL OS, GTIA graphics
XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)

All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.

Branch Always Software are the creators of:
ST Xformer (Atari 8-bit emulator for ST's), Quick ST, Quick Index, Gemulator (Atari ST emulator for PC's), and PC Xformer (Atari 8-bit emulator for PC's).

ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines. Very limited. Now public domain (used to be commercial).
PC Xformer 2.0 and 2.5 released for IBM PC machines. 2.0 is limited and supports only 800 OS. Both public domain (were always PD).
PC Xformer 3.0 released for IBM PC machines. Supports all OSes, 320K RAM, and best of all, player/missile collision detection (which MANY games use!)

Graphics:

The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection (which is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).

Sound:

Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the
comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for
IBM / MSDOS based computers, the PC Xformer 2.0 (XF2 for short). Many
people in the 8-bit community had gotten, well, fed up with the XF2-based
questions which did not pertain to them, or to the really dumb questions
which were in fact understandable to new or rusty Atari 8-bit users, but
had just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions. Now it's becoming a fairly good reference (and got me the job
of writing the commerical 3.0 release's documents!).
This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
supplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).
Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0,
and 3.0, the first commercial release, have been released. It is assumed
that the reader has the latest versions of PC Xformer (2.5 or 3.0), although
if you have 3.0, I must say, those documents are great! (If you don't get
the joke, look at the name of the author of the manual, and look at my name.)

---=== Xformer Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System. Be sure you're in 800XL or 130XE
mode. (130XE mode is only supported by XF3.0, not 2.5, but there is
no real difference in the operating systems.)
A.2.2) It may not work under the XL/XE Operating System (rare cases), switch
to 800 mode.
A.2.3) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.

A.2.4) It might be a BASIC game! Be sure you're in BASIC and use the BASIC
"RUN" or "LOAD" (and then "RUN") command. Also, be sure it works
with the BASIC you have. Some programs only run in BASIC XL or XE
(which are both cartridge-based BASIC's not currently supported by
the Xformer), and some run with TurboBASIC XL (disk-based).
A.2.5) It may just refuse to run on the emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note:
on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported
on the XF2.5. You might have to shell out the $29.95 for 3.0!
A.4.2) (See Question 2).

Q.5) How do I exit XF and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS
parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR
are both DOS boot-disk-images and are both in the XF25.ZIP file or
on your XF3 disk).

Q.7) How do I use MSDOS files with XFormer?
A.7.1) Add the files to the command line and use them as their respective
drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XFormer which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XFORMER from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XFormer. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.
A.7.3) If you can, use the MSDOS program ATARIMG, which is much like
S2PC but has a nicer, more graphical (less-menu driven) interface.
(Unfortunately, this doesn't run on all IBM's!)

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XFormer and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the

XFormer (and the S2PC program mentioned above). .XFD files are used
by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC
Xformer (XF2,XF25,XF3).

Q.9) What's SIO2PC?
A.9.1) Refer to the XFormer and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XFormer does) as a single file all alone
in its own disk. It also currently allows Print-Thru (all access to
the Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced XFormer users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS (4.50 and 4.53) presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)

[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XFormer, it's much quicker to just copy one .XFD or .ATR
to another).
[K] Make binary file: saves memory and makes it binary-loadable. See [L].
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)

disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN

that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current' or 'default' directory to a different place (a different drive or a subdirectory). "D:" can stand for "D1:" (like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory, files, multiple devices (up to 9 on MyDOS and newer SpartaDOS, 8 on AtariDOS)
E: editior - readable, writeable. This is how input from the keyboard and output to the screen is normally handled. If you wish to type a small file up by hand and have it sent to the printer or a file, use "E:" as the source.
G: graphics - writeable. This is not built into the Operating System but must be loaded. This is an Epson-compatible printer driver which can easily dump graphics.
K: keyboard - readable. This is just the keyboard. Input from it is not 'echoed' back like with the "E:ditor".
M: multi-mouse - readable, writeable? This is not built into the Operating System but must be loaded. This is a handler which runs in the background and accepts input from either a mouse, a joystick or a touch-tablet and displays a mouse pointer on the screen.
P: printer - writeable. Send data to this and it will appear on the printer. You can print files (documents, etc.) by

using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
W: Windowing (screens) - readable, writeable. This is a graphics
8 graphical windowing driver (rarely used, unfortunately!).
It must of course be loaded as well.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference

Manual). (As of Jan. 7, 1995, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with

SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft

of next line, accepts input)
Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them. When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear. When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys. It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is

format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?

____
[note:] Someone please give more details or corrections here! Thanx!
~~~~~~~
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
~~~~~~~

board or account you have access to, and then connect the modem
to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image)
files to and from SIO2PC disk images or PC Xformer XFD disk images
other than using Disk Communicator 3.2 on my Atari! I mean, both files
are disk images! They're both on my PC's hard drive! <cry>
(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)
A.3.1) Yes! There's a new IBM program out called DCM2DSK.
(Why "DSK" and not "ATR"? To keep people from getting confused with
the ATR-8000(?)) The current version is '2' and it's available at
UMich's archives and probably elsewhere. Filename: "DCM2DSK2.ZIP" in
the SIO2PC directory.
A.3.2) There's also a new program which converts DCM's to XFD's. I need to
look at it myself first before I can describe it (or someone help
me, please?)

---=== Where to get or FTP files mentioned in this FAQ: ===---

The PC Xformer 2.0 and 2.5 can be downloaded from the "ftp.clark.net" FTP
site:
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)

PC Xformer 3.0 can be purchased for $29.95 (prices may vary) from:

4063. Re: When did Atari kill the 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-11 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <138454@cup.portal.com>
Source record: 91800

The title of this thread is a little misleading. I think Atari was one of the last companies to support 8 bit computers & it was the market that killed them, not any one company. Chip makers probably had a lot to do with it also. We should all be working on 200 MHz 6502's by now, but Bob Brodie said the switch from 6502 line to 68000 was necessitated when it became apparent the 6502 chip makers had failed to advance the technology at the same rate as other manufacturers. The 6502 wasn't the only 8 bit system that went south. There aren't a lot of companies still making systems using Z80s or 6809s, both fine processors in their own right. A better title might be something like; "What stupid mistakes did Atari make that made them such a minor player in the 8 bit computer wars?" I agree with most of the comments being made, but after all; even the companies that made all the right decisions are history now. Apple seems like the only viable surviver & even it is allowing Mac clones.
Sometimes I even question my own loyalty to the 6502 vs a good design done right. If the Jag had a keyboard, probably not to much of a stretch, and a decent programming language for say $200 I'd probably be history here. A couple of PCMIA slots for HD, modem/FAX, ... It would definately be my dream home computer. Of course with Atari doing it we could expect them to charge an extra $1300 for including a $15 IBM keyboard an a couple of slots & sell it as "Falcon II" or some other such nonsense. I'm just throwing that last sentence in to let people know I can Atari bash also<g>.

In my case, it depends on what you mean by productively. The incompatibility issues are not really a problem, I must have at least 6 different ways of transferring files back & forth. I mainly use my 8 bit for hardware projects. Most recent one was an RS232 port in a cartridge with an 8 bit DAC for sound files. I gave it away within a week of making it since I'm more interested in the solder fumes then making anything useful. I've also done a number of esoteric hacks, several ADC designs/hacks, printer interfaces, you name it. The Atari 8 is incredibly easy to hack in this manner. I don't always have free time so the time I do have I'd rather spend hacking the Atari then one of the mainstream computers like the clones. Ditto for programming, I do it as a hobby & there literally isn't anything I can't do on the Atari in a a few hours that wouldn't take me days on another system. Atari 8's were designed such that when you have a lockup you just press reset & 1/2 the time you are back in the editor right where you left off. On my clones or ST, it power down & reboot losing everything that wasn't saved to disk.
IMO: Most people here are to some degree hobbiest. We know we have to desolder a few chips & make a couple of connections to do a ram expansion vs going down to the local clone store & paying $90 for a couple of simms & just plugging them in, so that's what we're about. I've heard the first cake mixes were "just add water", but they left housewives unsatisfied because they weren't doing enough. Ergo add one egg & milk became the industry standard for home baking. Needless to say, we find the Atari 8s very satisfying.

Jerry; in that list of names, wasn't there also a "Patty"? I recall going to the Atari wharehouse sale when they were dumping some stuff. I saw something executed in blue plastic, about the size of a 600xl, with a tag on it I *thought* was Patty. They also had 4 1450XLs there, but I got cheap & only offered $50 when they wanted $100. By the time I got back, the 1450s were all gone.

Can't say I can ever remember a "Patty", maybe this was an "XE" after the Tramiels took over in June of 84.

I think Bruce at B&C grabed the 1450's, I don't think you missed much there Rick, 1450 was a dog. Of course their was an Atari wharehouse sale almost every week, so you never knew what would come up. I swear I didn't remember that much junk floating around when I was there.

Speaking of names.....I don't believe the 1400/1450 ever had a codename? There was a "Sierra" system that Alan Kay was working on but I don't know any of the details. And then the Atari version of the Amiga was "Mickey" but no plastic ever existed, only wirewrap boards.

Sorry pal. The dos era is coming to an end. Wake up and smell the
Windoz. Win-95 beta 450,456,462 do games in a graphic window very well.
Even dos games. Windoom work fast with a 640x480 window. Thats on a lowly
486dx2-66 with 16 megs of ram.

4075. PC can read Atari SD/DD Disks?

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-12 00:00:00 UTC
From: cvallari@cec.uchile.cl
Message-ID: <D8H5H4.J4M@dcc.uchile.cl>
Source record: 91716

i heard that some PC can read (with a software) directly from its own 5.25
disk drive the disks of ATARI 8-bit SD/DD. I want to know how can i do this.
What kind of software i need, etc.
My problem is : i got many Atari disk but i dont have the Atari disk drive.
And i want to read these disks.

> It's a good point, but I remember the price differential when they
>shipped. An Apple HD cost about 3 to 4 TIMES what the Atari drive did.

Why are you saying HD, these were floppy drives. And the price
difference was not so great, certainly not 3x the price.

"The Disk II was finally available in July 1978 ... introductory price of
$495 (including the controller card) if you ordered them before Apple had
them in stock; otherwise, the price would be $595."

Apple used a 140K GCR format (Commodore got to 170K).

>And Atari came out in about 1978 (9, whatever), before the rest of the
>market had HD's at all. By that time they were locked in.

Was the 810 released with the 400 and 800, or was it later? And what
was the original price?

4077. 65XE Worth it?

Newsgroup: comp.sys.atari.8bit

Hi all,
Have been lurking for sometime and thought I would finally chime in. This newsgroup has rekindled a love of old machines that I thought had died. Getting my hands on any old 8 bit tech I can find.
I found a 65XE today at a thrift store in the area. It was in the original box and they had it listed for $20. Figure I could talk down to between $10 and $15.
Any suggestions on a use for it?
Thanks.

4078. RE: PCXF 4.0 req. Win95?

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-12 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950512145922.19369B-100000@PEAK.ORG>
Source record: 91719

I think it sucks that PCXF 4.0 requires Winblows 95....or whatever year moniker they'll slap on it. I wasn't planning on buying Win 95 for a long time - as crippled and imperfect as my PC is, I don't want to invest any more money in it.... I'm sure Winblows 9x will cost an arm and a leg. Furthermore, I'm sure it's in the design parameters for Winblows 95 to "render competing OS's incompatible" and pass it off as "improvements to Win 95 programs (code) to increase performance....kind of like IBM did to the hardware market when they came out with the Microchannel bus in 16-bit iteration on the PS/2 286 machines.... Whoops...got off-topic.

Anyway - someone please tell me that he'll revise the DOS/WIN 3.11 version - because I'm sure it would be easy to make reparations to the existing PCXF in comparison to the Win 95 version - and he'll **SEVERELY** limit his customer base for PCXF 4.0 until everyone gets "upgraded" to Win95... My 2 cents.

James

>other users? This is not flame bait, or a troll... I am seriously curious.

Bill answered the incombatability part quite well, so I won't
address that here. Instead, I'll address the productivity question.
The short answer is: Yes, we are able to use Atari 8-bit computers
productively.
The long answer is that we can word process, use data base programs,
do spreadsheets, do 256 color graphics work, and program very well with
our machines. :) There are numerous programs in each of the productivity
catagories for the 8-bit Atari computers.
And when it comes to output, in addition to what Bill said, we
can produce color thermal printouts, use a 4-color plotter (both without
any additional interface, because they are made for Atari8's), and, with
an interface, use 24-pin dot matrix printers, the latest color inkjets,
and the latest laser printers.
If you're comfortable with the programs you're using (and we
all definitely are..grin), and the output comes out of the same printer
our MS-DOs loving cousins are using, then any questions of compatibility
become rather pointless. :)

> I always thought the lack of real string support was great.

!!!

> In Atari basic you had a lot more freedom of what you could do
> with strings.

Try to make an array of them!

Any bit of code that you could do with the [x,y], you could do with a MID$(A$,x,y). The opposite was not true, just look at this example...

A$(1,5) = "You are in a room full of dark holes."

I had to do this all the time. Don't get me wrong, the idea of strings as arrays-of-char does have it's advantages, but it's only useful if you can then make a data type out of them.

> The only main was concatenating, but it wasn't that hard.

But it wasn't A$ + B$ either!

> I really liked the ability to have a string as big as you had memory for
> it!!

But most BASICs had that. In addition, they also had a little used but time saving integer data type too, A# was an integer. Using integer math resulted in less memory being used for the program (one byte or two rather than 6 to 10) and faster execution.

And don't remember that it took three releases of the BASIC to get a SINGLE bug worked out of it. Or that it was BY FAR the slowest basic in the home computer world. All in all, quite a poor showing.

Don't get me wrong, there were a lot of good things in Atari BASIC, it's just there were more bad things.

Maury

FREE TO GOOD HOME!

I have two boxes (1' x 1'x 2' big) full of mostly Atari-related magazines and books. Included are several years of Antic and many Analog magazines, as well as books about programming.

You can have these for FREE if you pick them up. I live in Duluth, GA (about 15 miles north of Atlanta). You can call me at (404) 447-4803 if you want to come get them.

If you want them shipped to you, you must prepay shipping and handling (i.e., what it's worth to me to make all of this HEAVY stuff shippable) which would be about $75.

DO NOT E-MAIL. I can't check my account very regularly.

Thanks.

The sad part is that it isn't so much that the atari "can't" do this or that, it's just that it hasn't been programmed.

For instance:

FAX - much discussed, never done.

PKzip/unzip 2.04g compatible (probably possible using banked ram, but not done. People are working on Zip of some type).

Jpeg/Mpeg - probably possible, but it would be too slow to be practical.

Or:

CD-ROM driver - Probably possible with BB and DOS update but not done.

Laser printer/24-pin printer support for things like DD3 - doable but no initiative!

Things which I think are impossible due to archetectural restraints or a lack of practicality:

True multitasking/windowed operating system

TCP/IP and clients

3D rendering (Chromacad was a noble but failed attempt)

Nope.. 4096 colors is pure software driven. Takes 1/2 standard RAM
(ie, 24K) and a LOT of processor time (most of it!? :)) to drive it,
as it's a set of THREE multiple-DLI'd screens.

I HAVE seen some (not animated, but that should be SIMPLE, but..) moving
64 color (uses the same hefty code) stuff... it was NICE... too bad
it takes so much time..

I think a better (more feasable) mode would be a derivation on UltraColor
or an IRG'd APAC.. (UltraColor, my invention, currently doesn't touch
DLI's although I guess it's about time to try it.. it'll probably look a
lot nicer).

Anyway, umm.. oh yeah, 4096 colors is in 80 x 192 (low low res :( )
using three 16-shade images... one red, one green, one blue..

The invention (or at least the original software using it was) of Jeff
Potter...

get a hold of JView XL and download a few GIFs and enjoy the colors! :)
(anyone ever use AT8GIF? man, no comparison here! :)) (except AT8GIF
can zoom in more than 100%... Jeff, will we ever have this???)

As for MODs... well, we have 6bit 4-channel (approx 6Khz or Mhz or Hz
or whatever the hell sound uses) audio with MODplay, but unfortunately,
the MODs must be limited to around 96K or less since the author of MODplay
doesnt have an upgraded machine!

Other players also do 4-channel, and their quality varies.. I did an article
in _Current_Notes_ about digital sound (mainly mentioning WHAT does it,
inclduing a breif comparison of the MOD and MD8 (converted MOD) players
I had access to, and then talking about my simple WAV/SND -> DIG converter
and DIG player I wrote)

>was the original price?

When comparing the 810 and original Apple drive you have to bare a few things in mind.

1: The 810 was an "intelligent" drive with 6507, the Apple was not.

2: The 810 had to pass FCC approval and the Apple did not.

The 810 shipped about 3 months behind the 800 and had a suggested list of $799.00. Keep in mind that each floppy at 90k still stored WAY MORE than the standard 800 memory of 16k. Not many people filled up a 90K disk back in 1980 in the Atari world......so who cared about 140k at an even greater cost.

The Apple controller board was actually a real marvel at the time and I think was directly attributable to Woz himself. Atari was always stuck in the early days by FCC class B computing standards. This was the price we all payed for having that RF modulator in the console. Apple had no modulator internal untill the FCC rules relaxed.

Jerry

4089. Top9207b.dcm! (and note to UMich archive keeper (Jody Lenn??))

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-13 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3p186k$keh@nic-nac.CSU.net>
Source record: 91730

GET THIS FILE! Under Demos (and currently Newitems) at UMich.. it's side
B of the Top Magazin for July 1992...

It has TWO killer files:

1) Landscape - a simple one screen (unless there's a PAL problem,
but probably not) demo.. Nice 4-color art, nice bouncing scroller
(how they fade it out on the left and right confuses me, though),
but best of all, >> KILLER MUSIC! << Like Hard Soft's Cool Emotions
demo, it has a player which presents the following for your enjoyment:
a) Digital music nothing new
b) The screen's on VERY not new, but incorporated with (a)? cool!
c) Synthesized music also VERY not new.. on the surface, mixing
it with (a) doesn't seem to special, except
it's SIMULTANEOUS!
Inotherwords, digital music AND sythesized music at the same time, along
with the screen on and a scroller... this is NICE! :)

2) Oxygene - Ever see Mirax Force for the Atari 8bit? I believe it's
a clone of "Uridium" for the Commodore 64 and Commodore Amiga (I've
seen it on my brother's C=64.. it's a NICE game). Oxygene is a
somewhat CLOSER representation of Uridium. The graphics aren't as
nice and detailed (the enemies), and the game slows down a little
every once in a while, but the space ship you play as is more or
less IDENTICAL (even with the REALLY spiffy left-to-right transition)
to Uridium's, AND the enemies move up and down, not just left and right
like in Mirax force.. but, they're all the same color. I'm sure
nowadays someone could pump out both with an extremely dynamic set of
Display List Interrupts, but anyway... at least this one is free! :)

The Landscape demo is by U.S.S.R. (Union Software of S???? R???? .. I won't
even try because I know I'll screw it up).

Oxygene is by T.A.T. (I've seen at least one other thing by them.. a demo
with a neat rotating sphere cage and a PMG scroller bent around it in 3D..
music wasn't the best, was all around not the best demo, but was still ok)

anyway.. my babble.. go get it.. again, it's at:

ftp: atari.archive.umich.edu

atari/8bit/Demos/top9207b.dcm

I think top9206b has some neat stuff too, but I don't think I looked at
it too closely.

(BTW, this is one of the 1/2 dozen or more Top Magazins recently uploaded)

Oh, and to.. umm... Jody Lenn? (you handle the UMich archive, right?)...

why are these under "Demos"? They >ARE< disk magazines, after all!

(oh, and if I were to release a game with a level editor, could it get
it's own directory? (either under Games/ (which doesn't seem likely since
you seem to keep the UMich hierarchy 1 level deep) or just under Root?)

Thanx!

UnZIP is around.. dunno which standard? (hell, this Unix box I'm on can't handle better than 1.1 or something, damnit! <:^( ) a new unZIP is being worked on I've heard, as is a JPG viewer...

Wasn't someone also working on TCP and/or PPP or something?

As for true multitasking.. yeah, impossible. An intelligent, unpre-emptive task-swapping is VERY possible, but since it's NO pre-emptive, that reduces the amount of software you can use (ie, all of the old stuff has to be taken care of by a baby-sitter like SnapShot)

4092. Atari XE Game System for sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-13 00:00:00 UTC
From: markda@markda.mry.scruznet.com
Message-ID: <3p1kiq$97a@news.scruz.net>
Source record: 91733

Well, my office at home overfloweth, so I've (reluctantly) decided to part with some of my equipment. I've got the following for sale:

Complete Atari XE Game System
all of the original packaging (I save everything)
includes all original manuals plus all the accessories that came with the system
Light Gun
Bug Hunt Cartridge
Joysticks
subLogic Flight Simulator II cartidge
XF551 floppy disk drive
all the following software (C = cartridge, D = disk); all include manuals
Alternate Reality: The City (D)
Alternate Reality: The Dungeon (D)
Atari Assembler/Editor (C)
Archon (C/D)
Blue Max (C)
Music Construction Set (D)
DOS 2.5 (D)
DOS XE (D)
Advan Basic Compiler (D)
Ace of Aces (D)
includes the following books
The Atari Assembler
Programming the 6502
Compute's First Book of Atari
Compute's Second Book of Atari
Compute's Third Book of Atari
Machine Language for Beginners
Assembly Language Programming for the Atari Computers
De Re Atari

This machine is in mint condition and has worked very well for me. I'd rather sell the whole lot at once, so please don't ask for individual items. I'm really interested in finding a good home for this equipment. If you'd like to make an offer, please e-mail me (markda@scruznet.com). Thanks!

Mark Davidson

I have a friend who is selling his 130XE. It was upgraded to 1
Megabyte bye FTE (Fined Tooned Engineering). It's got a special Power Supply,
if the Power Supply blows, you can open it by unscrewing it and replacing the
blown fuse. Great for a BBS!

$250.

Serious replies considered.

Please, direct all replies in E-Mail to:
bensmith@teleport.com
or for faster results, call Ben anytime at:

>moniker they'll slap on it. I wasn't planning on buying Win 95 for a
>long time - as crippled and imperfect as my PC is, I don't want to invest
>any more money in it....

Yes, it does suck!!!! I've been using os/2 for about 5 months now, and
it completely blows Windows 3.1 out of the water, and after seeing some
of the press about Win95, it blows it out of the water too!! I wasn't
planning on upgrading to Win95 either.

>I'm sure Winblows 9x will cost an arm and a
>leg. Furthermore, I'm sure it's in the design parameters for Winblows 95
>to "render competing OS's incompatible" and pass it off as "improvements
>to Win 95 programs (code) to increase performance....kind of like IBM did

I don't think it will cost that much, MS wants to get it on everyone's
PC so they can sell all of the software that Microsoft sells!!!!
(Actually, I like Word and Excel, and especially how well they run under
OS/2!!)

>Anyway - someone please tell me that he'll revise the DOS/WIN 3.11
>version - because I'm sure it would be easy to make reparations to the
>existing PCXF in comparison to the Win 95 version - and he'll
>**SEVERELY** limit his customer base for PCXF 4.0 until everyone gets
>"upgraded" to Win95... My 2 cents.

Since Darek works for Microsoft, I really doubt he'll bring it out for
regular DOS/Windows.

Sorry about the waste of bandwidth!!

4095. Re: When did Atari kill the 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-13 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <138706@cup.portal.com>
Source record: 91736

On the topic of 200 Mhz Atari. There's been at least two people I've heard this from, the tech guru at JDR & Mike Holman. Someone has said they've] done a complete 6502 in a PAL/PEEL/PGA, whatever you want to call the latest greatest programable logic devices. I believe these things take a clock up to 100 MHz. Prices seem to run $10-$30 for these puppies so I'm not sure why they did it other then an exercise to show just what they can do: Doesn't make a lot of sense to use one of these devices when you can buy a real 6502 for less. Another whine warning; it sure would have been great if instead of custom chip set these things would have been around in the 800's hayday. Atari could have updated all the custom silicon by just changing the programming.
BS about strings, since I won't actually code anything. If someone really missed the two dimensional string arrays, it would be very easy to just do a two dimensional numeric array & have it point to a string. The printing of the string could be easily handled by a USR(). Somthing like

```
DIM P(4,4)
P(0,0)=ADR("HELLO")
...
X=USR(1536, P(0,0))
```

It'd still be slow because of the FP, but almost recognizable to users of Microsoft Basic. It'd probably need a zero at the end of the string like Atari Roots uses in most of their examples, but it's use would be fairly clear.

>
No upgrade needed, but there is a bit of flicker in the 8, 64, and
4096-color modes, because they actually alternate between 3 different
color screens. The software to do this is Jeff Potter's APACVIEW and
COLRVIEW, or JVIEW (JVIEW requires an XL/XE).
APACVIEW decodes GIF pictures into a form that can be displayed on the
Atari with COLRVIEW or other programs. JVIEW can decode and show the
pictures, and save them in "ColorSquash" form, which saves disk space.
There is a program called "ColorSquashView" which does a slide-show
display (takes a few seconds between pictures to uncompress them).

Itay, another program everbody likes that I haven't had the time to check out<sigh>. IMO: It shouldn't for most cases as long as the RUN vector is used, but I *REALLY* don"t know for sure. I'll pull out my Action! cart & test it out. Something like 2 or three Action! programs 'COPY /A' together with the last one patched for RUN vs INIT vectors should do the trick. There
is a saying that goes something like, "Anybody who thinks they can make something idiot proof is really underestimating the determination & resourcefulness of your average idiot." I think it is possible to override the default config of SDX such that even on an expanded system you have no banked ram available regardless of how much ram you have.

Mike; don't know your level of expertise so forgive me if I say something you already know. The 850 is made such that if won't boot if there is an active drive attached. This was apparently done so the relocatable loader in the 850 could load higher then any DOS you use. You should have an RS232.SYS file somewhere, just load that from the DOS menu or use a termninal program with a built in handler.

4100. Atari 8-bit RGB Monitor Capabi

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-13 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505132218.AA270753530@relay1.geis.com>
Source record: 91741

Atari 8-bit RGB Monitor Capabilities

To answer the question of whether the 8-bit can be connected to an RGB monitor, my response would be a qualified "YES".

In the December 1993 AC, there were two articles dealing with this subject. One was Bob Woolley's TTL monitor hack; he described how to interface a monochrome TTL monitor to both the XL and the XEP-80.

Another article by Larry White described how to connect an 8-bit to a particular brand of multisync RGB monitor.

Quite a few of the most common questions dealing with video were addressed in that issue of AC.

SIO2PC Article

[RE: Rick Cortese's comments in response to my post on his SIO2PC piece for AC]

Rick, thanks for offering me a free shot at you, but I'm not going to take it. :)

If you've developed a hack for SIO2PC that allows folks in distant corners of the world to substitute more easily available parts, that is certainly a legitimate subject for a feature article in AC. By all means, proceed!

I'm reading my mail here in "chunks" & have not yet encountered any posts from Mike Jewison. However your comments RE: that he flamed this newsgroup are disturbing. I've developed a personal rapport with Mike Jewison over the past few years; flaming people isn't his style. If indeed he did, he must have had a good reason. (On more than one occasion it was Mike who reeled me in when I was frothing at the mouth & straining at the end of my tether.) I will read with interest whatever he may have posted & decide for myself whether his comments constitute a "flame".

As to whether people will order back issues of the Feb '93 AC containing the SIO2PC reviews, the question is academic. NO one will order them, because none exist. The Feb '93 issue is the only one missing from the backissue inventory now in the hands of Bob Woolley. AC very nearly foundered in Dec '92-Jan '93 due to slow subscription sales. To keep enough money in the magazine's treasury to fund future issues, I was forced to order a cutback in the production run of that issue. When word got out that the Feb '93 issue was in short supply, suddenly the few back issues sold like hotcakes, with many people sending in subscription orders demanding to commence their sub with that issue. By June of 1993 that issue was sold out. The only way anybody can get one now is to buy it from someone else.

- Ben Poehland

PS- thanks for the tip RE: openings at Alza (nice to know people are willing to look out for me!). But I've made an executive decision not to seek re-employment until my mother's illness ends and her estate is settled. In the meantime I'm having a little fun dabblng in the stock market. 1995 is proving to be a *very* good year to dabble...
And when I do go back to work, I'm not even 100% certain I'll return to science. I have quite a few cards on the table these days.

4102. Re: 65XE Worth it?

Newsgroup: comp.sys.atari.8bit

Well I'll be obvious & say it's worth it<g>. If I was you though, I'd check it out on a TV or something in the same store before I bought it. You can use any power supply that puts out about 1.5 amps at 5V, but if you want to buy one vs hacking one it'll cost you an extra $10 or so. If the power supply & computer work, it's a go. Repairs in general cost more then a working Atari so I'd think twice about buying a busted one at any price. I'm opinionated, I like a good keyboard & frankly, the 65XE's is not the best. There's also the matter of no access to the buss like you get on an 800XL or 130XE so if you were planning on adding a HD it's almost out of the question. The computer has built in BASIC & I'd guess is compatible with +90% of the cartridge software out there. There's other issues like storage and or memory expansion that you'll get more then a few opinions about. Let us know what direction you want to go & I'm sure we can offer a few suggestions.
Rick

4103. What I've been doing A8wise, cont.

Newsgroup: comp.sys.atari.8bit

Source record: 91744

Well, a small lesson here worth mentioning to budding self-repairers.
As you recall, my 256k 800xl quit on me while I was trying to restore
another 800xl and was using the 256k as a 'compare' machine. After
much hunting, I finally found the problem, which, if could have
remembered (short term memory bad), I probably would have remembered I
pulled and put back in the Antic just before the 256k quit. So here's
the principle involved, (I think). The whole computer needs a basic
'clock' pulse, which is provided by the crystal and Q8 and Q9. This
clock pulse goes to GTIA, pin 29 first and then to Antic, pin 30.
Sam's says check the clock oscillator, then pin 29 of GTIA then pin 34
of Antic. I got as far as pin 34 of Antic, where no correct wave was
present, which Sam's says to check the Antic chip. I swapped in a new
Antic, still no work. I checked to see that pin 35 of Antic had its
clock pulse. After much hunting, I thought, every chip needs a power
supply to it. The power to Antic is pins 6 and 21. Pin 6 had power,
pin 21 did not. BUT there was power to the bottom side of the board at
pin 21. You guessed it. The contact on the socket for pin 21 was bent
and not contacting pin 21 of the chip.
End of story.
I ordered a 800xl field service manual. Anybody seen this? Is it any
good?

I did a lot of adventure game programming. Trust me, the lack of real
strings was a terrible handycap for my work. It also made porting much
harder. In fact, I once converted a program that used a long run of
commands that read string data into the string array into a series of
PRINT's as GOSUB's. Worked fine, but hardly a nice solution.

> printing of the string could be easily handled by a USR(). Somthing

Howdy Bill

I once thought about adding four F-keys (the ST line has keys numbered F1 thru
F4 (yep, I forgot F5 thru F10, don't need that many. :-) )) to my 130XE, but..

- The 130XE's case doesn't look like it's strong enough.
- You'd probably see that it was "user installed".
- The keys would have to sit flush with the already existing H/S/S/O/R keys,
so I'd probably have to damage the keyboard.
- I've got an UltraSpeed Plus O.S. which doesn't use these keys anymore
(some functions are put under other keys though.)

Would have been really cool though. An XE with 9 keys overhead.

4096 colors? That's software (I know about these) or hardware (don't know about these)???

BTW 16-bit CPU's are kinda out these days, and 4 MB is way to low in the MessyDOS world these days. Man, if only the 6502 related chip in my SUPRA faxmodem would fit in my 130XE. :-)

j >
j >Anybody have any recommendations?

Howdy James

Haven't read it in years, but just browsed through "Your Atari Comes Alive"
by Richard Leinecker and David Burd, sold by Alpha Systems. Looks O.K.
Don't know if they are still around. It's a book and disk package.

There is even a sorry about alarm systems inside.

They start by telling you basic things like, very basic electronics, how to
"decode" the colors on a resistor and mention memory addresses.

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

BTW the book is a bit dated.

Howdy Kevin

Try the Super Archiver II and BitWriter by CSS (see vendor/developer list).

It can copy all your disk. Atleast that's what the ad sais. Never used a
Super Archiver or BitWriter, cause my first drive was an XF551.

Howdy folks

Some time ago, I found a project by David Deaven, with which it is possible to scan IR remote controles, load the commands into the classic Atari and send them back out again. (I downloaded the files from Beco Tel. SysOp Bernard Kok had found them on the Internet)

After I found somebody who plotted out the PostScripted schematics, I now need to find the following piece of hardware;

Sharp GP1U52X IR receiver hybrid circuit.

David sais in is README.HRD file, that Radio Shack sells those babies, named RS276-137, for $3.49 a piece. I've found a supplier overhere, but they only sell them a large quantities (1000 pieces). I only need ONE.

Who could help me out here? Please E-mail.

4115. Re: When did Atari kill the 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-14 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <138732@cup.portal.com>
Source record: 91664

Maury: Well, as far as BASIC & speed goes, I have fortunately forgotten
just about everything I ever knew about it. It's just
to restricting, in the pointer example I used it would not only have
problems with speed, but the nummeric array would store all the addresses
as 6 byte FP numbers vs integers.
I have a love/hate relationship going with pointers, I know C, but
don't really see myself as a typical C weenie like you get in the
MS DOS world. It only seems like fun when you go beyond the scope of
the language. For instance, the printf routines really only expect
to see the start address of a NULL terminated string so I've done
silly stuff like reading all my character data into a huge byte
array & instead of passing strings, just passed pointers to the
printf routines for whatever I wanted to print out similar to the basic
code example. I really prefer Action! over C or basic now that I've used
it for a number of years.
I did make what I thought was a sincere effort to write 'good' basic
code, but the speed issue & sloppy code <mine, grin> were always a problem.
I even bought the MMG Basic Compiler back around '85 & distributed an
80 column term program about '88 among my friends that I compiled with
it, but still: It sucked.

Anyone have an old 800 keyboard they'd like to part with?
It's very difficult to type without a space key.

4118. Weird Corvus story

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-14 00:00:00 UTC
From: bjcorr@delphi.com
Message-ID: <9505141944592.DLITE.bjcorr@delphi.com>
Source record: 91667

I just repaired (almost) one of my old 800's to run on my Corvus HD and
it's doing the strangest thing. After the initial boot off the 810 (which
then programs the joyports for I/O and hooks in the Corvus) I am able to
shut off the computer and reboot from the Corvus, not the 810.
This is NOT supposed to happen.
Every time I reboot the computer it's supposed to reboot the Corvus software
so that the OS can see the Corvus. The only way around this is to rewrite
part of the OS as the Integrator board does.
My Integrator is NOT in this computer.
The 810 sits there without a peep. The Corvus lights dance around and up
pops the Corvus DOS.
I think I have gremlins.
Of course, this is rather convienient, but strange.
Hmmm....
Once I shut the 810 off, things go back to normal.
Hmmm...
It IS a Happy 810. They DO have, what, 4k of memory. No, that doesn't make
sense. Forget it.
I'm baffeled.
bjcorr@delphi.com

4119. Itay's XE

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-14 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505150144.AA147072283@relay1.geis.com>
Source record: 91668

I was glad to see Itay got his XE problem fixed. It never occurred to me
to question his +5V bus. I missed that completely. Low voltage on the
bus, however, certainly explains the bizarre color effects he reported.
GTIA color bias is very voltage-sensitive. Any change in the bus voltage
will be immediately observed in the color signal. As the voltage further
declines below acceptable TTL levels, (say, 4V), then signals on the logic
bus will start getting screwed up. I delved heavily into the GTIA color
bias in "Color and the Clock" in the Dec '93 issue of AC.

In my articles on Atari power supplies I assigned the XE supply designation
as Type 4. I nicknamed it "The Peanut", because it's the smallest of the
four major types. It's also the WORST performer of the lot. Although rated
at 1.5 amperes output, the one I measured put out less than one ampere.
That's terrible! I think Itay's XE supply failed because the series pass
BJT in the stock supply developed a junction breakdown due to prolonged
thermal overload. These type breakdowns take awhile to develop. The extra
thermal stress was created by the additional current draw from the upgrades
in Itay's XE. A stock 800XL draws about 600mA, but when you add a bunch of
hardware goodies & a few stacked ROMcarts you can draw over 1 full ampere in
no time at all. The failure in the stock supply *might* have been avoided
if additional heatsinking were added to the pass BJT... but there's no room
inside the case for it!

Another possibilty is that the 723 regulator inside the stock supply shut
it down in response the developing thermal failure of the pass BJT. As the
BJT gradually went into breakdowmn, its output impedance increased. This
impedance is in series with a current-sense resistor in the output. The
circuit is designed so that when the sum of the junction impedance + the
series resistance exceeds a certain value, the 723 shuts off drive current
to the base of the pass BJT & the 5V output drops to some very low level,
close to zero. The computer will of course die but not be damaged by this
type of controlled shutdown. (You getting all this, Itay? :))

Itay was *lucky*. The series pass junction breakdown could have manifested
as a collector-to-emitter short. If that occurred, the supply would pass
a full +12V unregulated voltage into the computer. There would be some
interesting pryotechnics, & Itay would be left with a 1-meg doorstop.
Itay made a smart move by going over to a PC-type switching supply.
I had forgotten how crummy the XE power supply is. It was one of the
many reasons I dumped the XE altogether & went over completely to XL machines.

Of course, switching supplies (I call them "bewitching supplies") are possesed
by their own peculiar set of demons. Some switchers put out a flat voltage
up to their rated load; those are the exception however (if you have one like
that, it's a rare jewel!). The more commonly available cheapies from places

in the Far East exhibit Gaussian or inverse-parabolic load-response curves. I installed a unit like that in a custom system for a guy last year, assuming naively that the specs printed on it could be interpreted literally. Nope. The first time I fired up the system the PSU was under-loaded & put out 6.5V on the 5V bus. I came within a hairsbreadth of blowing up the entire system. Ultimately I devised a combination of resistors & hefty zeners to ensure a safe voltage output at any load. Unfortunately my regulator circuit squandered about 15% of the switcher's output, but it was a small price to pay for the peace of mind to know the PSU wouldn't blow up the computer if a load (such as a disk drive) was unplugged.

I've been running my main system off a switching supply for 3 years now. It powers not only my 1-meg 800XL, but also my XEP80, BB/FB, hard drive, & four PBI floppy drives. It has worked fine ever since I installed a fan in it. (It worked OK without the fan, but the smell it emitted when it got hot made me feel sick.)

4120. THUNDER CHILD LIVES!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-14 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505150144.AA146962279@relay1.geis.com>
Source record: 91669

So, it was Rich Mier who suggested Thunder Child had a funky CPU.

Well done, Rich! My thanks to you yet again!

You mentioned one of your failed units was a 1-megger. Hmmmm... I've had a Newell 1-meg in service now for over 2 years (installing one of those is a pure bitch, the instructions are horrible). On several occasions, usually during the summer, & after my system has been on for several hours, I've suffered several incomprehensible system failures. A little like what I experienced with my 600XL: the machine "forgets" things. Minor stuff, like it can't find the SIO or loses files transferred over the PBI from my hard drive. (Not so minor, actually!) This nearly always happens in the wee hours of the A.M. when I'm not too alert anyway, so I chalked it up to something I was doing wrong, shut off the darn thing & go to bed. The next day (when all the guts have cooled down) everything is fine again. I blamed the Black Box/Floppy board for it, assuming something in there was overheating (the 2 boards are sandwiched together pretty tight, no ventilation, covered by the black plastic case). I did drill holes in the BB/FB case, which seemed to help. (Or maybe I imagined it did.)

Looks like I may have to open that machine up again & give the CPU a hard workout, & maybe replace it if it gets flaky.

Still, it freaks me out that a 6502C can work just fine with 16K or 64K, but then gets a case of thermal hiccups when you add more RAM. Any explanation for that? And if true, I would think ICD would have been deluged with complaints from people who installed RAMbo cards & then had their 8-bit go flaky on them shortly thereafter.

Or, is it simply that these CPU's are now >10 years old & were about to croak anyway? (The Synertek chips I trashed all had 1982 & 1983 datecodes on them.)

As to whether there is a repository of final cleaned-up debugged proven hacks somewhere, I don't think so. Various people on the Net have launched themselves into a project of that nature over the past several years, but I don't recall anything substantial resulting from it. Another one of those Holy Grail type things that everyone wishes for but whose scope is beyond most people when you get down to the details of doing it. I do have one such collection around here, but it's full of gaps, ommissions & blatant errors. *sigh* (And no, I'm not going to send out copies of it to anyone, so please don't ask.) Yet another missed marketing opportunity for someone like FTE, Best or CSS. *sigh*

- Ben Poehland

PS- Nobody recognizes the name "Thunder Child"? No sci-fi readers out there? (That was a hint.) Two gold stars & a dogbone still waiting here....

4121. 1050 Mechs & ROMs

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-14 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505150144.AA147142284@relay1.geis.com>
Source record: 91670

I noticed a post from someone who was experiencing some frustration with replacement 1050 mechs onto motherboards bearing incompatible ROMs.

I also have experimented with swapping unmatched ROMs & mechs, & my experience was much like what that person reported. If the ROM doesn't match the mech, you get failures.

Actually it's more complex than that. Reason: both Tandon & WST used different *TYPES* of ROMs furnished to Atari for various production runs of the drives. (Atari made at least 6 different production runs of the 1050 that I've identified.) And just to make it even messier, Tandon not only used different types of ROMs but also produced at least 2, possibly 3, versions of their EPROMs.

My information is by no means complete, but here's a summary of what I've found so far:

```
-----------
WST DRIVES
-----------

2732 EPROM, Rev. 5 J=2,4 $7B63
2732 OTP ROM J=2,4

--------------
TANDON DRIVES
--------------

2732 EPROM, Rev.K J=2,4
2732 EPROM, Rev.L J=2,4 $6594
2532 Mask ROM J=1,3
```

Explanations:

EPROMs are just the garden-variety 4K 2732 w/quartz window & paper label.
OTP ROM is a black plastic ROM w/2732 pinout; One Time Programmable.
Mask ROM is a custom mass-production ROM; different pinout than std. 2732.
J=x,y is the motherboard locations of the jumpers that should be CLOSED when that type of ROM is installed.
$xxxx is the checksum (hex) of the firmware file.

Only the Tandon replacement mechs are readily available (from ATV). ATV's claim that they work in all 1050's is a crock of crap. They will only work in 1050's that have a Tandon ROM or which have been modified with a U/S Doubler. (Possibly might work also in Happy drives or CSS modified drives; I have no experience there.) It always amazed me that you could install a U/S Doubler in a 1050 that contained EITHER type of mechanism & it would work fine.

So, what do you do if you have a WST drive that bit the Big One & the only replacement mechs you have are Tandons? WST mechs are not generally available. (I did actually buy one from Best once, but he charged me a fortune & grumbled a lot.)

It's a lot easier, & a lot *cheaper* to just get the ROM. Problem there is, nobody sells these ROMs that I know of.

A couple years ago I commenced a small project whereby I began compiling an archive of custom ROMs. I think I might have 30 or 40 ROM files now. On several occasions I've burned ROMs for people who were desperate. I don't think I want to offer a general ROM-burning service, but if that fellow who had the 1050 problem will send me private e-mail I'm sure an arrangement could be made to get him squared away.

Why setup do you have? I have a 256K 800XL.. It MAY want 256K, but I'd guess not.. it has a lot of large space ships for levels, but they can be compressed not only with standard compression algorythims, but also because every 2x2 block on the screen is of one shape or another, so you can cut the size of a level by 1/4th by just saying "this is a set of blank spots" or "this is a space ship on a runway".. Also, when you start some levels, it seems to take a while before anything happens.. might be decompression occurring..

Also, my 800XL is Newell 256K and it is NTSC..

What about your system? Anyone who can read German, can you check the docs on side A of that issue of TopMagazin and see if there's any nonstandard requirements?

Also, did you remember to disable BASIC? :)

You guys were arguing about pins 34 or 36 on the CPU in a thread about the
"put an IDE in your 1200XL" upgrade.

Well, just remembered that "Sams Programmer's Reference Guide for the Atari
400/800 Computers" has pin out of the 6502 (just sais 6502 microprocessor),
GTIA(or CTIA) and ANTIC.

Looked it up. (Just the 6502)

Pin 1 __ Vss
Pin 2 __ RDY
Pin 3 __ 01 (Out) [the 0 really looks like a O with a slash thru the middle.
Pin 4 __ IRQ (inverse) [it's got a line over it]
Pin 5 __ N.C.
Pin 6 __ NMI (inverse)
Pin 7 __ SYNC
Pin 8 __ Vcc
Pin 9 thru 20 __ AB0 thru AB 11
Pin 21 __ Vss
Pin 22 thru 25 __ AB12 thru AB 15
Pin 26 thru 33 __ DB7 thru DB 0
Pin 34 __ R/W
Pin 35 and 36 __ N.C.
Pin 37 __ 00 (In) [same character as pins 3 and 39]
Pin 38 __ S.O.
Pin 39 __ 02 (Out)
Pin 40 __ RES (inverse)

Guess pins 3, 37 and 39 are clocks, but.... I'm no hardware man (or software)

I heard something about fax software here again.. ie, there is none for the Atari..

Well, I don't know German, nor do I know how to operate the fax part of a fax modem, nor can I hook up a modem to my Atari at the moment...

BUT... there is a program called "Fax Software" (I think), on...

you guessed it! The Top Magazin July, 1992 side B disk! (top9207b.dcm)

Can someone check it out and post a simple review?

Rick,
Thanks for the reply to the post. I figure I'll end up picking the comp up
sometime this week. I don't really have any particular use for the thing excep
t that it may be fun to play around with. I guess its major appeal is putting
together working systems for less than a major software package costs. Using
old hardware from the "golden" era of home computing makes that possible.
Actually if anyone here has any suggestions for a use for the machine I
would be glad to entertain suggestions. I have thought about the possibility
of having it as a dedication 'Net machine. Not as many bells and whistles as
the PC but I don't see why it couldn't be as fully functional.
I'll keep you posted.

>worked on I've heard,

As for the UnZipper, I did an UnShrink-only version in LightSpeed C for
about two years ago. It's on my ftp directory and on the Atari 8-Bit Homepage.

Quote from The Atari 8-Bit Homepage :

----begin-quote------

It's distributed here in the same form as it was published on Mega
Magazine #6. In addition to that, I also provide the Lightspeed C
source code here.

[..]

Please keep in mind that its capabilities are very limited. It's only able
to extract and unshrink files from a ZIP-File. Also, large files which
fill up the dictionary up to 13-bit codes can't be unshrinked with this
utility due to the lack of memory provided by LightSpeed C and its Runtime
library which consumes a lot of memory.

----end-quote---------

URL's....

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit/unz113b.arc (binaries)
ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit/unz113s.arc (binaries)

I hope to receive an Action! cartridge by the end of this week and I'm
planning to rewrite the whole thing in Action! and also add explosion and
deflation.

>as is a JPG viewer...

>task-swapping is VERY possible, but since it's NO pre-emptive, that reduces
>the amount of software you can use (ie, all of the old stuff has to be
>taken care of by a baby-sitter like SnapShot)

Preemptive multitasking IS possible on a 6502 machine. I won't go into details, but just think of an IRQ timer which interrupts the currently running process every 100ms or so, saves the registers in the process table, does some stack saving (i.e. all bytes pushed to the system stack have to be saved somewhere in memory, for example in a 256 byte array created when the process was created) then reloads the registers with the right values for the next process and leaves the IRQ routine...

I hope this isn't against any rules for this newsgroup. If so can
suggest a proper way to do this?

I am interested in selling the following, preferably to someone in Houston so
I don't have to worry about packing the electronics.

I don't expect to make big bucks. I just want this stuff to have a nice home
(sounds like I'm getting rid of my favorite pet, doesn't it).

I haven't had this system together for several years so I can't say what
condition it is in. I do know that 2 of the 3 disk drives got to where they
would only read floppies they had written. The other one was still able to
read original floppies (i.e. floppies purchased or obtained from external
sources).

HARDWARE:
---
1 Atari 800 (with switch box for TV)
3 Atari 810 disk drives
1 Atari 850 serial interface
1 Atari 410 program recorder
1 Wico joy stick (this is a heavy duty joy stick, not the normal plastic
junk)
1 Atari track ball
1 printer cable (i.e. 850 to epson printer cable)
6 power converters
6 I/O cables

1 9600 baud modem (not Atari stuff. this is an early 1980's vintage modem)

Could you tell me where the files are on the internet? I had thought
about this idea for awhile, because it would be nice to add some
programmable functions to remote controllable devices, like a sleep
timer for a VCR, a sleep timer for a stereo, an alarm timer for a VCR
(Wake up to the Simpsons!!!!!!)

I don't have access to a Radio Shack, since I live out in the middle of
nowhere, or I would look for the part you need. Hopefully someone else
knows.

4138. HTML viewer for the 8bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-15 00:00:00 UTC
From: rlcolli@ibm.net
Message-ID: <F04tvQ7YaiTD083yn@ibm.net>
Source record: 91679

Does the above exist for the Ataris? I'm hoping to have some free time this summer, and I was looking a project that might be worth the time to do for others. I'm looking at writing a Web browser, but it would only be useful for viewing files off of a disk, since I do not have the knowledge to do a tcpip slip driver.

On a related note, are there any docs around with the specifications of HTML? Most of the stuff looks pretty easy, but I don't want to be caught with any surprises.

TIA

4139. Re: SIO2PC/Rverter cables

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-15 00:00:00 UTC
From: rfunk@magnus.acs.ohio-state.edu
Message-ID: <3p8571$92m@charm.magnus.acs.ohio-state.edu>
Source record: 91680

Well, I looked at the plans for an Rverter-style interface that are at
umich, and compared that with the sio2pc plans. I think I've come up
with a way to combine them that doesn't require any additional logic
-- just the MAX232, a 74LS02 quad NOR, a diode, a resistor, and some
capacitors.

However, I noticed that Ken Siders' Rverter plans fake a tri-state
output with a NAND gate with a diode on the output, while the sio2pc
uses true tri-state outputs. To minimize the number of chips needed,
my plan uses the NAND/diode version, but I'm not sure if this would be
OK. There would be 0.7V drop across the diode on a high output, and
if it's low while the bus is high, there will be some current leaking
back. I'm not sure yet if this will be a problem; I haven't built it
yet.

Does this sound satisfactory to all you hardware people?

I already have two Adaptecs chained together (LUN 0 and LUN 1). I now have a third hard disk setup I'd like to add to the chain, but am not sure how to setup the Adaptec to be LUN 2. LUN 1 has SW A & B jumpered.

How do I configure Adaptec #3 to respond at the third? Which SW setttings need to be jumpered?

Anybody?

You just answered youself. The Happy can buffer one complete
track and has the smarts to use it. Apparently all the HD needs
is on that track and the 810 never has to spin up.

4144. More ideas for PC-Xformer...

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-15 00:00:00 UTC
From: toby@cyberspace.com
Message-ID: <3p8pnq$ggl@case.cyberspace.com>
Source record: 91685

To Branch Always Software:
Here are some Ideas for your next version:
- Better Player-Missle support, in games like chopper rescue, you can't play them because it is so off!?!
- Pretty Pretty Please add sound support for sound cards (SBpro/Adlib)
- Add disk drive tones (optional from cmd line) and speaker clicks ("")
- Software for an 8bit w/850 interface to transfer files via null modem cable. (+PC sw)
- Pop-Up control Menu (ctrl-f12?) to toggle disk tones/speaker/sound/adjust settings
- Implement some way of exporting files from XFD/ATR images.
- batch load files into images.
- harddisk support (Supura 10 meg) or something.
- Built-In R-Time 8 cart (enable/disable with pop-up menu)
- Maybe 1450XLD emulation, w/voice synth., 256+k ram, 4 meg ram (?), direct atari DD floppy reading from PC drive, built-in star raiders, pacman, etc. + print to msdos file, built-in 850 interface (black box?) using PC's serial ports (card), XMS/EMS/UMB mem usage....
- **Maybe Even** a dual-screen system in which you could run 2 tasks simultaniously on the same monitor, and hit a hotkey to jump between them.
- Cart Slot, Cart Images + 8bit SW to copy carts to images, right cart slot, build PC serial interface box w/2 carts, sio(2), joystick ports(4), start/select/option keys (real)
- Pop-Up ATASCII ref. chart, hex/bin/dec/oct calc+converter.

> Hmm, brainstorm, brainstorm.... wouldn't it be cool, if you could do the same
> with the ECI on the XE (or remaining signals on non-XE computers)?

You've been reading my mind :-) Yes, I'm going to be looking into
the possibility of connecting stackable cartridges in series, rather
on top of each other. This will be a seperate board, though which
will sit on the cartridge port. The Rom scanner would then fit onto
one of the available slots.

I've also got plans for a similar thing to connect several PBI or ECI
devices to the Atari in a similar way. Let's face it, the size of
some of the PBI stuff is rediculous and sooner or later, you're going
to end up out of desk space behind the computer and your Atari is
therefore going to end up on your lap. The idea I've got is to allow
PBI devices to be connected vertically like in the PC. That way,
you'd only have to worry about having enough extra desk space to
allow connection of the largest PBI expansion currently available.
Could come in handy for connecting stuff that doesn't have a
through-port as well ...

Any more ideas? Let me know.

Yikes! Now I've seen it all! $250.00 for a 1meg Newell XE..

Figure about $30 for an XE and $45.00 for the upgrade kit and about
$30.00 in 1meg DRAMS for a total of maybe $105!

4148. Atari 800 and lots of extras auction!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-16 00:00:00 UTC
From: alextoth@aol.com
Message-ID: <3pbekn$a3j@newsbf02.news.aol.com>
Source record: 91689

Alex's Atari 800 Auction

Here's the deal. Auction in theory ends on Sun, but I reserve the right to extend bidding. I also reserve the right to reject any bid for any reason. I also reserve the right to stop the auction if there is a lack of interest. I am using a temporary AOL account right now, and I am changing within the next week to a different one. I will still continue to check this one for a while though. My address is:

AlexToth@aol.com - formerly atoth@vax.clarku.edu

I have done lots of deals on the net and have a clean reputation. I only accept payment by money order (postal or bank is fine). Shipping will be UPS or US mail if it is reasonable. Shipping is paid by the buyer. I will consider part trades for any item - ask for my want list.

Item #2 Atari 800 Package:

Hardware:
-Atari 800 Computer- your standard tan 2 cart. system. It's in very nice shape w/ orig styrofoam, SIO cable, Basic cartridge, and boxed power supply and RF switch. It also includes an original Atari dust cover.
-1050 Double Density Disk Drive - seems to load fine, comes w/ orig. box, styrofoam, instructions, shipping inserts, etc. I haven't used it enough to see if it loads consistently, but it is in almost new condition.
-410 Tape Drive - Has all the materials listed above. It works fine.
-850 SIO/Serial port adapter - lets you use a modem on the computer. Comes w/ orig. p/s and seems to work fine, but is basically untested.
-1020 4 Color Plotter -in unknown working condition. I think the p/s may be dead.
-Lot's of extra SIO cables.

Software:
The Tax Advantage Disk- Unknown condition
Fraction Action box, disk, and manual - works fine
Atari DOS disk
Master Typist disk - unknown condition
Atari Word Processor disk - " "
Pilot disk, copied - " "

Misc.
Atari DOS 3 Manual
Compute: Atari Graphics
Compute: First Book of Atari
Various Product Updates
Shrinkwrapped orig. manual

Atari Products catalog
Atari Basic Book
Introduction to DOS
Orig. Receipt (over $600 originally!!!)
Warranty cards and other assorted stuff

Minimum bid is $75, may later consider offers for some items if I can't sell as a unit.

Thanks,
Alex

>
> - Ben Poehland

After running into several of the "brick" power supplies that bit the dust, I came up with a solution to use a linear supply that I found in abundance at various hamfests years ago.

The supply was made by Emerson Electronics, and is model ECV5N3-1. It is rated at 5vDC @3A. It's a bare supply on an aluminum angle bracket. I bought several for $2-3 a piece, mounted them in a Radio Shack case and added a power switch, led, mov protection and fused output. It made a nice package and ran my 256K 800xl on a BBS for about 4 years. Since it was well under the power rating, it never got hot. I made one for my own 800xl, and kept the old Atari supplies for those days when I took my system to the user group meetings.

As I recall, the case cost as much as all of the guts... I think the total price to make one of these using surplus parts was around $16.

When it interrupts it should push the current PC/IP onto the stack, when the interrupt is called. So it should be *somewhere* on the stack, heh. I have never really thought about multi-tasking on the 6502, but it has been done and I can see it very possible. It may be slow as Windows, but at least it isn't. <grin>

I beleive you move the jumper to C & D. for LUN 2. E & F would make it
LUN 4. I can't be positive because my Adaptec Manual is on loan. Hopefully
I will get it back tonight. I pretty sure that the first 3 sets of jumpers are used
to set the LUN.

>knows.

If Radio Shack has stopped carrying them, you can get them from
digi-key by mail order. I'll look up the part number and have it
available in case anybody wants to get the IR recv box that way.

One of these days I will probably get back into this project and
release some better software for the thing. Especially if people are
actually interested in this stuff... seems perfect for the "Atari
Classic" machines, which you can get for cheap.

Oh, by the way I have some ASCII versions of the schematics if
anybody is having a hard time viewing the postscript. I use a Unix
workstation to do all my 6502 development so postscript is my format
of choice.

I've been trying to get my head around multi-tasking on the Atari for
some time. My question is, what's the best way to actually save the
system registers? Also, how do you keep track of what the program
counter's doing?

Ah! Why couldn't 6502 assembly be as easy to use as 68000?

Ryan, I worked on a simple text-based HTML file viewer in Action!
I didn't get too far because you can already see that unless you want to
NOT view graphics, and NOT be able to jump to linked pages, you're going to
have to download ALL of the files (HTML, TXT, GIF, JPG, etc)..

I got so far as simple implementation of bold, italic, Headers, Title,
Lists (numbered (ordered) and un-numbered).. didn't do word-wrap though :)

I heard we may get TCP or PPP or something one day, so maybe THEN I'll
work on a WWW browser! :)

WHAT VERSION OF PC XFORMER ARE YOU USING!!!!???

Sound is available (so I haven't heard <har har>) in the commercial version
Speaker clicks is available in all of the latest versions (w/o sound card!)
There are MANY ways to transfer files from Atari to PC, ESPECIALLY if you
have an 850 (try BobTerm!). If not, just get an SIO2PC (why would you
want the emulator, though!?)
There is a disk control menu in the commercial version (and I think I
heard also in the latest free version??)
To get files into/out of .ATR disk images, just get S2PC (no "IO" in there)
or AtarImg
The commercial version supports 320K RAM
There is software out there already to read DD Atari disks on an IBM!
The commercial version (supposedly) supports R: (modem) and P: (printer)
access
To switch between two programs, get SnapShot for the Atari, or get MS-Windows
or OS/2 or Linux (if PC Xformer runs under Linux) for your PC! :)
A big ATASCII chart is available in the docs. to PC Xformer 3.

BTW- I'm the keeper of the "Unofficial Atari 8-bit New User, Emulator Help
FAQ" as well as the author of the User's Manual for PC Xformer 3.0
(commercial release).

It does run under Linux, using dosemu. I just switched over to
another virtual console, started dosemu, started xformer, and played a
round of Frogger. Of course, when it screws up, it's hard to tell
whether it's xformer's fault or dosemu's fault.

The ultimate extension of this would be to get xformer running in a
remote X window, so I could play with it on the HP workstations at
work and school.

(OREGON and WASHINGTON STATE RESIDENTS ONLY, PLEASE!!) =D

Hi,

I am looking for ALL, OLDER (non-Nintendo/Sega) VIDEOGAME CARTRIDGES
and HOME VIDEOGAME SYSTEMS.. HOPEFULLY the thought of throwing them away
hasn't crossed your mind.. <aaack!> =)

*Like These:

-ATARI: 2600/5200/7800
-COLECOVISION
-INTELLIVISION
-ODYSSEY
-VECTREX
-ATARI 800/XE, Etc.. (cartridges)
-COMMODORE (cartridges)
-BALLY ASTROCADE
-EMERSON ARCADIA
-FAIRCHILD "CHANNEL F"
-SPECTRAVISION
-MICROVISION

*I am interested for the most part in buying game cartridges, preferably
with boxes, manuals, overlays, etc..

"What do I do, Chris?"

1.) Please send an EMAIL-LIST of what you have, ie. TYPE of system(s),
HOW MANY cartridges? do they include BOXES, MANUALS, OVERLAYS, GAME
PIECES, etc? Please include CONDITION of the items (working?)

2.) Sorry, I am not looking to pay exorbitant amounts for items, garage
sale and thrift shop prices at the most, But if you have any doubts,
please still contact me.. EVERYTHING is negotiable..

3.) Please be willing to sell INDIVIDUAL COMPONENTS (cartridges, etc),
I don't always need everything! =) But, if the price is right, I WILL
buy the collection..

4.) Please Check your E-mail OFTEN for replies and other
arrangements, I check and respond to mine daily/nightly..

5.) I PREFER to buy within PORTLAND, OREGON and other close-in areas, but
will travel short distances.. Sorry, I am not interested in buying
through the mail..

*Besides Email, I can ALSO be reached at (503)297-6568 (if not there,
please leave a message)..

*"Games? What Games?
I Don't Need No
Stinking games!!"

-Chris.. =)

Going to 64k is easy. Remove the 4416 Ram chips in U12 and U11 and replace
them with 4164 Ram chips. Next find U18, a 74LS32 and pull it out.
Bend out pins 8,9,and 10 and reinsert the IC. Turn the board over and
solder in a jumper wire from pin 8 to pin 10 of the same IC.
Next pull both the 74LS158's at U5 and U6, bend up pin 3 on one and pin 10
on the other. The chip with pin 3 bent up goes into U5, the one with pin 10
bent up goes into U6. Finally solder a jumper wire from the bent up pin 3 to
U2 pin 4, the bent up pin 10 to U2 pin 5. That's it. If soldering onto the
chip at U2 makes you nervous, you can follow the traces from U2 to a pair of
solder pads you can use instead. The pads are to the left of U15 right next
to pin 16, aprox 1/16 of an inch apart, one on top of the other. Bent up pin
10 goes to the top pad, bent up pin 10 to the bottom pad.

Going beyond 64K is another matter I will defer to more knowledgeable folk.
Good Luck!

Everybody here seems to have their own uses for their 8 bits; everything
from productivity to games. If you're handy with a soldering iron you
may want to get the plans for SIO2PC off the archive.umich.edu Atari
8 bit area. I'm a little biased since the last PC I bought was an
XT clone, complete with 30 meg HD & monitor for $40. The SIO2PC will
let you use something like this as a replacement for a real Atari
drive & is very reliable. But like I said, I'm biased, I don't have
a lot of copy protected disks that I run much anymore. I also replaced
<still have them> my 1050's & 810 with a single ATR8000 that has a couple
of 720k 5.25", one 720k 3.5", & one 360k 5.25" drive. This wouldn't be
a satisfactory setup for most people since it can't handle enhanced
density mode or Sparta DOS high speed I/O. I think most people would
want at least one real Atari drive attached to their system for booting
any copyprotected software reliably. ATR's seem to have serious trouble
with any disk you flip over i.e. Ultima III, to access the data & if
it's on an enhanced density disk, forget it.
The 65XE has built in Basic, but if you enjoy programming, there's
Turbo Basic as well as a 'C or 3, several macro assemblers. Best
drawing program is probably BBK Art. There's a large number of
games floating around, stuff like Burgers, Planetary Defense, Roto,
... all of which I played using a leather glove to keep my hand from
blistering when I was still doing the game thing. Ditto for productivity
software being available. Textpro seems to be the WP of choice, I used
to use it's grandfather SpeedScript with a couple of direct connect
printers before I got a PR:connection, 850, ATR.
If you want to spend money enhancing the system, a RAM expansion should
be one of your next hacks. After that, maybe a different OS chip, but
that's only if you get real serious. Keep an eye out at the Salvation
Army Stores as well as Goodwill. Going price on carts is $1.50 to $5.00
with newer titles still available at significantly higher prices.
An RS232 device is a must if you don
't have a clone to D/L with & something like SIO2PC to move the files.
I sort'a gave up using my Atari for telecommunication, my kids took the
4 external modems I was using with them so I'm only left with a card
in a clone, but like I said: With SIO2PC it's not a real problem.

SOON! SOON! SOON!

Coming soon from New Breed Software (maybe before Cooltris 2, maybe right after Cooltris 2):

SIMPLE SHANGHAI

I'm sure it's not any better than any of the commercial Shanghai (Mah Jongg) games I haven't seen on the Atari 8-bit (I know there are at least two of them), but it should prove to be a bit nicer then My Jong (by Bruce Fish), which is what I live with when I need a does of the tiles...

I was hoping to implement an UltraIRG Color version (and have it called "Rainbow Mah Jongg" or "Rainbow Shanghai"), but I'm having enough fun trying to figure out graphics algorythms in black and white at the moment, thank you very much.

Speaking of the graphics algorythm, it uses a pretty nifty intelligent character set-based drawing routine. (Each tile face is 2x2 characters, and the 3D part of the tiles are made up of other characters.. some standard for ALL tiles, some get figured out based on how the surrounding tiles are, and some are based on precalculated masking (when the 3D part of a tile overlaps 1/2 of a tile on a lower level)).

Enough of the complex stuff, though.. the FEATURES! :)

Customizable sets - Make your own tile sets (will come with an editor)
Customizable tiles - Make your own images for the tiles (editor, too)
Changable angle - From the right (3D depth and width) or center (3D depth)
Help - Online help (if I've got room for it)
Hint - Match a peice, find a set of peices
Unlimited undo - Undo all the way back to the first move!
16 tile shapes - I could do around 30 but I'd lose the text
Pointer controlled - Use the joystick (perhaps choosable input device?) to control a mouse pointer
Pull down menus - Options are controlled by a Mac/ST/Amiga/Windows/GOS/etc. menu system
Change pointer attribs - Color, speed, animated shape
Timer - Time your games
Cheat modes - Pull peices from all four directions (not just sideways), or simply straight up!

I know it doesn't SOUND very "simple," but compared to other Shanghai games, this IS! (I COULD add the color, animated tiles, animated scenes and digitized sound effects when you remove tiles, backgrounds to the screen, dropping tiles, etc.!)

Look for it soon! (It's being written in Action!, by the way.. as is
Cooltris 2. It will definitely run on a 48K machine with MyDOS 4.5,
and I'm sure it can handle Atari DOS and SpartaDOS, but testing that might
be advantageous!)

Any comments are very welcome!

> it isn't. <grin>

Some time ago (OK, a long time ago) I wrote a multitasking kernel for the
6502. It was pretty crude (time slicing, mailboxes and semaphores), but
it did work.

The biggest problem is the stack, since you can't relocate it. Since this
was running on custom H/W, I just remapped the stack page when a task switch
occured. If you wanted to implement something similar on the Atari, you
would need to either copy the current tasks stack to a safe area (which would
cause a big performance hit) or allocate a fixed segment of the stack page
for each task. The latter is pretty dangerous, as there is no stack limit
register.

If you want to get at the stored PC, you need to copy the SP to an index
register, and offset into the stack page from that. ISTR that the offset
(with all registers pushed) is $104-$105, but it was a while ago. If you
are using memory remapping, you obviously need to do this before you
swap pages :-)

I'm not quite sure where the source is now, but if anybody is interested,
I'll have a look through all my old backup disks and try to find it.

Now, where did I put those 8" floppies.....

Pete

>counter's doing?

The OS should have a Process Table setup before any process is execed. Its
size has to be fixed and thus limit the number of processes. This is also
the case on all unix systems I'm aware of. Here behind this sparc I regulary
get a 'no more processes' notice. As for the Program Counter, it's pushed
on the stack together with the statusregister when the IRQ occurs.

BTW I made a small, but crucial mistake in the story above. Before one
loads the registers with the right values one has to restore the old stack
(and with that automatically restore the right values for the Program
Counter and the StatusFlags).

>Ah! Why couldn't 6502 assembly be as easy to use as 68000?

Ehuh???? IMHO it's the other way around! :-)

4176. Current Notes Changing Hands

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-17 00:00:00 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2FB9FAB9@POST0.LAAFB.AF.MIL>
Source record: 91618

Joe Waters has given me permission to release the following information:

Current Notes is changing hands. The May/June '95 issue will be the last published by Joe Waters, who has been at the helm for about 11 years. That issue is at the printers and will be mailed shortly. Subscribers should have it in a week or so. There was a two week delay do to transition activities and Joe's hurt arm. (He couldn't type for awhile.)

Details on all this will be contained in Joe's editorial, which I haven't read yet.

The new owners are Canadian.

I plan to help in anyway possible during the transition to the new owners. (I'm still collecting and editing 8-bit articles.) I do plan to step down after the transition so some new blood can be infused into the operation. I've been at this for three years myself.

By the way, the May/June issue of Current Notes has a ton of 8-bit articles.

More to follow as events unfold.

Rick Reaser

The programming language QUICK is doing it just this way. Up tp 4
programs may run at the same time - with real multitasking. The time slice is
normally about 1 sec.

Ahh, GameLink, I remember that neat 'lil invention quite fondly. I believe it was designed by Chuck Steinman of DataQue fame back around 1990. The original design was quite simple to grasp, but not too sure about GameLink II as I haven't really looked into it. It was quite neat to play "tic-tac-two" head-2-head on seperate computers back then, in fact, I was so intrigued I programmed a neat head-2-head battleship game for it that provided great hours of competition for my brother and I. I had some great ideas for GameLink, but never did commit myself to program another game. I still have the cable and software somewhere, maybe I'll program DOOM for it. :)

4179. Request help 800xl null modem driver

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-17 00:00:00 UTC
From: wcm1@cornell.edu
Message-ID: <wcm1-170595120421@128.84.239.122>
Source record: 91621

I need help moving data files out of Atari 800xl to Mac SE via null modem cable. Has anyone experience doing this? The situation is this: Mac SE to recieve files has ample ram (4 meg), 40 meg of HD under sys 6.0.5, 80 meg of HD under sys 7.1 and Apple Communications Toolbox module of Claris works. Using the serial port handler, x-modem protocol and the null modem cable physically connected to the SE modem port, the software indicates that it is ready to recieve files. Various handshake options have been tried without a sucsessful transfer. On the Atari end I have three software options available. Kermit reports inability to acsess comm port R2. GoldCard 212 and 212 Express dont seem to offer options which indicate they accept the possibilitiy of a null modem connection. GoldCard 212 will attempt to transmit the x-modem data buffer, but the (virtual) connection aborts and no data is actually recieved at the Mac end. I have carefully checked my null modem cable connections, so I suspect the problem is software not understanding that the modem is Null, not physical. Any suggestions? thanx. Bill.. wcm1@cornell.edu

Hey! I've seen your game, I think! I downloaded it, not realizing it
was for GameLink (had never HEARD of it, actually, until I read the docs to
your game) and was disappointed! :)

I had no access to GameLink (either where to get a cable or how to make one),
nor did I have any extra computers..

How does one program for GL, anyway? And yes, a DOOM like game would be
GREAT! :) Even if the graphics are very simple... unfortunatelly, it seems
the best ANYone has gotten the Atari to do (with any amount of speed) is
90degree rotations (Maze of AGDAgon, Alternate Reality, Amazing Maze, etc.).
>I< haven't even figured out good 3D in simple 90degree (unless it's crowded
hallways like Amazing Maze.. the limitations of the maze makes the 3D view
generation code much simpler and much more straight-forward :)))

Just in case you forgot I asked by this point (because I almost did, and
I'm WRITING this message!):

How does one PROGRAM for GameLink !?

Some example code (pseudo, Action!, [Turbo]BASIC XL would be very helpful..
assembly would not :))

1) The SIO2PC software for your PC
2) Some SIO2PC software for the Atari (in a disk image)
3) Instructions on building the cable
4) A list of parts needed to build it and where to get them
& 5) Where to buy a cable (unassembled or assembled) if you don't want to build it

are all contained in the latest SIO2PC .ZIP archive, available at your friendly Atari 8-bit FTP site, including:

ftp atari.archive.umich.edu atari/8bit/Sio2pc/
amiga.archive.umich.edu
msdos.archive.umich.edu
etc.

or

gopher gopher.archive.umich.edu Merit Archives / Atari Archives / 8bit / Sio2pc /

If you're unaware of it's capabilities, it supports up to 4 drives, stored either in the ~540K of RAM it has (on a 640K or better machine) or on your PC's hard drive or floppy drives. Drives numbers can be from 1 to 8 for any drive and you can swap drive numbers at any time. (To use a two-sided disk, load side 1 as D1:, load side 2 as D2:. When it asks you to "flip the disk", you just tell SIO2PC to exchange D1: for D2:.)

The disk images can be from as small as 1 single density sector (128 bytes) to as big as 8MB (single density) or 16MB (double density)! You'll want MyDOS or SpartaDOS (3.x or SDX 4.x) to take advantage of the high capacity. (Old Atari DOSes only go to 90K or 128K).

You can also install files directly off of your PC's drives as single files on temporary read-only drives. Say you get a new game that's .ARCed. It's on your PC's hard drive and you want to try it out. Load SIO2PC, load a bootable DOS disk image with an unARCer on it, boot your Atari, load the unARCer, then tell SIO2PC to put the .ARC file in as D2:. Tell then unARCer to unARC from D2: onto your RAMdisk or D1: or some other disk. You never had to copy it to any Atari drive to use it!

Anyway, good luck!

Dah! I'm an idiot! I'm sorry! Since each peice in Simple Shanghai is made up of 4 tile face peices, but then another 4 calculated characters, that's 8 per tile face. Using only 1/2 a character set (64 characters), that leaves us with only EIGHT tile faces per tile set.

Sorry! My previous post saying it will support 16 is false, and we'd NEVER see more than about 15 or so without using a bitmapped mode. (We can still of course make the screen generation fast there, since no special bit shifting would be required.. we'd just need more than 1K of tile data space).

If you have NO idea what I'm talking about, it's ok.. just know there's aNOTHER new game coming out from me (and this is one of two programs currently "active"- being worked on every day or so), and it's a Mah Jongg (more exactly, "Shanghai" clone) game.

It'll let you make your own tile layouts (how the tiles are spread on the screen) as well as your own tile shapes (what the tiles look like).

My whole point is in an earlier post I said there'd be 16 shapes, but I was wrong.. :)

There! I'm done

Hi All,
I picked a couple of Indus GT floppy drives for Atari at a local
thrift. Just the bare units, no power supply or cord, disks, etc.
Question is: Do I need anything "special" other than power, to test
these? What are the power ratings? Any help is appreciated.

Allan

4188. Help!!! I need to transfer files!

I have an 800 with 2 810s, a broken 1050, a 1010, an 850, and one of those 300 baud acoustic modems (830?). I have a PC with 2 serial, 1 parallel port, 2 floppys, etc. I *NEED* to transfer files between the PC and 8bit. I don't have time to build or buy SIO2PC, I must get these files across. Does anyone have *ANY* software for the PC *AND* 8bit that will work together to transfer files or XFD/ATR/DCM images or disks.....PLEASE help me! My 8bit is going to be throwen away by my parents if I don't get the files off...I need a way to get the software onto my 8bit, someone said BobTerm, but it's so big (40k), at 300bps, it would take 3 days!!! (arg) I just need a non-buggy emulator for once and basically a replacement software product for my PC to simulate my 8bit exactly. I don't have any money, so I can't buy PC-Xformer 3.0, right now I'm running 2.52, and desperately want sound for an SB, modem, printer, correctly-aligned player-missle support (chopper rescue literally crashes (the chopper) because it's all mis-aligned.), and all my disks on the 8bit on the PC, instead. Please POST or E-MAIL. Thanks, I want to save all my atari files from the trash can.

4194. Pictures of Ataris to Upload

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-17 00:00:00 UTC
From: gfenwick@mcs.dundee.ac.uk
Message-ID: <3pco8j$833@dux.dundee.ac.uk>
Source record: 91636

I've been fortunate enough to get access to a colour scanner, and have a picture of some Atari peripherals from an advert (I've recaptioned it, and tidied up the backgrounds, but left the peripherals as they are) I'd like to upload to the Atari archive at umich. How do I do this AND ensure it gets to the mirrors. I don't want to post it to a mirror in case it doesn't get accepted to all the other mirrors, and umich kept timing out 'cos it was so slow. So, if you want some nice pictures of Ataris (I'm going to do some of my own, which should be better quality- this was a first go), I'll need some help on this. Thanks!

You can't live in a global society without getting your hands dirty somewhere along the line.

^^^^^^^^^^^^^^^^^^^^^^^^^

I beg to differ, I believe the slowest basic language belongs to the TI99/4a. It's interpreter interpreted basic to ANOTHER interpreted language, then finally to the machine code. I ran some time tests with the TI many years ago against my TIMEX SINCLAIR 1000 (which also has a VERY slow basic, and the SINCLAIR beat the TI if I ran it in fast mode (ie. screen blanked out while it was thinking)

Source record: 91562

Hi,
I was just wondering how many bugs people found with XFormer 3. These are the ones I have found so far:

Using the Atariwriter, the control characters don't show up, eg CTRL-P for paragraph. All it shows is a black spot.

Howfen DOS doesn't work (at least the menu), meaning I can't run BCs Quest for Tyres which is on that disk...

The screen also seems to go too high as well (ie some of the top is off the screen)

In the self-test mode, the orange isn't correctly aligned on the option line, it appears to flash on two lines at once (especially when option is pressed).

Does anyone know if this will be corrected in the next version?

Use the 3 sets of jumpers as OCTAL, set A-B being the Least
Significant Bit; E-F, the Most Significant Bit. Example:
A-B and E-F Jumpered (Shorted) = LUN 5.
I hate long posts but you should get the idea.

Power for the Indus GT 8Bit Floppy Drives is 12 V. AC.
I use a Power pack from an Atari 5200. DO NOT use the Power
Packs for a 1050. They are only 9 V. AC. The only other problem
you might see is if they are VERY old, pre DOS 2.5 and then only if
you are trying to read a Enhanced Density Floppy. If they fail to read
it, the PROM needs ungrading. BTW if they have 'Future Systems'
on the bottom tag they have the new PROM.

|> with).

I still have the source code. The system takes a little getting used to,
and you have to understand how the interrupts interact. You'll notice that
serial communication continues (at a 32Kbps clip) while the program runs
in the foreground.

|> I finally got a copy of Maze of Agdagon and maybe if we (us Northern CA'ers)
|> get a user group, we'll register it, get a couple (or build some) real
|> cables (I've made the paper-clip-based test one :)) and have some fights! :)

Chuck Steinman and I advertised, in the DOC files, that we'd sell either
the cables or an 8-user circuit board. Only about three responded. I am
preparing one of the two circuit boards I managed to build up for shipment
this week. If you try to connect more than two or three Ataris together,
you'll find that POKEY (which drives the serial lines) can't source enough
current to them. So my 8-player circuit board puts an active device (powered
by the Host Atari's +5V line) to buffer the signals.

Building the circuit board was a lesson in frustration itself. I tried using
those "Iron-on" toner methods to transfer a pattern to copper, then etch.
Very low yield...

|> Anyway, if anyone can give me details on writing software for GL2, what
|> other software is out there, how hard it is, what language(s) can or must
|> be used, etc., please get back to me.

You've got to do the interrupt handling in assembler. The outer shell of
your program could be written in Action!, C, or even a version of BASIC,
once you work out how to pass information to and from the interrupt handlers.

|> (Jeff, I know you're out here! :))

Yes, I haven't been monitoring every message, but I am out here...

Hmm, I'll have to load up AW+ and take a look.

>The screen also seems to go too high as well (ie some of the top is off
>the screen)

I don't have this problem. Did you try hitting PgDn to move the XF
display down a scanline at a time?

>In the self-test mode, the orange isn't correctly aligned on the option
>line, it appears to flash on two lines at once (especially when option is
>pressed).

Yes, it does seem that XF3 wasn't tested with the self-test. I
think I mentioned this particular problem to Darek before he
released 3.01 (some of my other suggestions are incorporated in that
release).

Also in the self-test, the voice 2 test doesn't work for me. The rest
work fine. I haven't played with the sound enough to know if the
problem is limited to the self-test.

>Does anyone know if this will be corrected in the next version?

And if it is corrected, will we have to pay for the bug-fix updates?

>using SIO2PC?

You need a program to convert cartridges to files. I think there are
a few utilities of this sort at umich. I haven't tried it yet...

>Also, does anyone know where I can get a disk image of VisiCalc, SynFile
>and the Macro Assembler? I have a LEGAL copy of these but because
>they're copy protected I can't copy them over to PC Xformer ... :(

I think I remember once seeing a version of visicalc floating around
that existed as a normal file that could be run from any DOS. I don't
know where to find it though.

For the others, you'd probably need something like Chipmunk or other
protection-breaking programs.

```
(Rich Mier says Indus GT takes 12v ac.)
I believe that's more like 12 DC.
I agree, don't use the standard 9v ac Atari brick.

Atari 8-Bit Computers

Vendors and Developers List

Revised 15-May-95

----- All Print and Disk Magazines are now listed here. ----

Additions/suggestions/comments/corrections are needed! Please send to:

Michael D. Current
URL:mailto:mcurrent@carleton.edu

Where to get the latest copy of this list:

The home of many FTP archives, automatically updated monthly:
URL:ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev

The World Wide Web hypertext version, automatically generated monthly:
URL:http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html

Alternate hypertext version, not as fancy, in Europe:
URL:http://www.cs.ruu.nl/wais/html/na-dir/atari-8-bit/vendev.html

Usenet newsgroups where this list is automatically posted monthly:
URL:news:comp.sys.atari.8bit URL:news:comp.answers URL:news:news.answers

You can also send for this list by mail.
URL:mailto:mail-server@rtfm.mit.edu, message says:
send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at URL:mailto:mcurrent@carleton.edu

Conventions
-----------
All commercial vendors, developers, and publishers should be listed here.
"Major" shareware/freeware/PD developers should also be listed.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, public domain
software/freeware/shareware, commercial software, used (commercial)
software.
```

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information is given, including prices.

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of the more prominent sources I use. Current Notes magazine, and their 8-Bit Editor Rick Reaser. Atari Classics magazine, published by Jim Hood and Bob Woolley. And The Atari 8-Bit Omnibus, published by David A. Paterson.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

>was running on custom H/W, I just remapped the stack page when a task switch
>occured. If you wanted to implement something similar on the Atari, you
>would need to either copy the current tasks stack to a safe area (which would
>cause a big performance hit)

IMHO this is not true. I agree, saving 256 bytes everytime a process gets
scheduled out and restoring 256 bytes when one gets scheduled in, will be
a 'big performance hit'. But one does not have to do this. When the stack
of one process is 'shadowed' somewhere else in memory, one has only to save
the bytes that are actually pushed on the stack in the last interval and
restore the bytes of the new stack that are actually used. For example,
process A pushes 6 bytes to the stack. IRQ occurs. 6 bytes are saved. SP
is set to that of process B. B pushes 7 bytes. IRQ occurs. 7 bytes are saved.
6 bytes are restored. SP is set to that of A. A pulls 4 bytes. IRQ occurs.
_No_ bytes have to be saved. 7 bytes are restored. SP is set to that of B
etc. etc. This way, one severely reduces the number of bytes to be saved
and stored. (Only programs that do recursion and use, say, 200 bytes of
the stack will lag the system, but such programs should not be written
like that but use their own internal stack.)

>or allocate a fixed segment of the stack page
>for each task. The latter is pretty dangerous, as there is no stack limit
>register.

Though it's not a bad idea. If programs are written with care, no problems
should occur. For example, a maximum of 8 processes will give you 32 bytes
of stack space for each process.

>If you want to get at the stored PC, you need to copy the SP to an index
>register, and offset into the stack page from that. ISTR that the offset
>(with all registers pushed) is $104-$105, but it was a while ago. If you
>are using memory remapping, you obviously need to do this before you
>swap pages :-)

>I'm not quite sure where the source is now, but if anybody is interested,
>I'll have a look through all my old backup disks and try to find it.

>Now, where did I put those 8" floppies.....

4219. WTB 130XE, 850 I/F & 1050 Drive w/all Docs & Disks

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-18 00:00:00 UTC
From: bcurrey@ais.net
Message-ID: <3pfhde$8nt@raptor.ais.net>
Source record: 91645

I'm looking for an Atari 8 bit preferably a 130XE or whatever, w/1050 disk, 850 I/F, & attach for Epson Par Printer w/DOS, BASIC, System Manuals, & other book(s) that might help me get some stuff over to a P.C. from the Atari. I used to have a 400XL (gave it away many moons ago) so I'm somewhat familiar (but foggy). If you have one you you like to sell send EMAIL to bcurrey@ais.net.

Thanks,
Bob Currey

4220. FOR SALE: complete 8-bit printer package, cheap to a good home

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-18 00:00:00 UTC
From: junkster@coho.halcyon.com
Message-ID: <3peeap$q9s@news1.halcyon.com>
Source record: 91646

I have a complete "Atari 8-bit printer kit" I'd like to sell to someone who can really use it. It includes:

(1) Star NX-1000 9-pin printer. Features several fonts and NLQ mode. Uses tractor feed paper or individually fed sheets. The printer includes the original box and manual. In great condition; everything works fine.

(2) Plastic printer stand. Lets you put a stack of paper beneath the printer. Output is caught in a tray.

(3) Atari 8-bit printer interface. I don't have it with me at the moment, but I think it's an MPP.

All of this, including shipping, is $50. Free shipping is significant, because it will probably run at least $20.

James Hague
junkster@halcyon.com

This is the way the original code was written (before the hardware remapping
was implemented). I wasn't actually suggesting that the entire stack page
should be swapped out in software.

Another consideration that I didn't mention in the original post is that
I was using a fairly short timeslice (20mS), and the overhead reduces as
you increase this.

In the application, there were two tasks with large stack requirements, and
they had a tendancy to run sequentially (one got suspended on a mailbox
read, and the other wrote the mailbox - which caused a task switch).

Under heavy loading, the %age of time spent in the kernel got really
high (>60%), and the ring buffers on the serial handler overflowed,
hence the hardware solution.

>

> of stack space for each process.

Once it's working, there's no problem. Debugging this kind of code can
be fun, though; an overwrite will probably not cause immediate failure,
since the affected task may be suspended - even if it isn't, the affected
data will be at the far end of the stack and may not be used for some time.

A very nasty variant of this is when a return address gets overwritten by
another return address (belonging to another task), and you get two execution
threads through the same code. As it's nearly impossible to write pure
code on a 6502, this tends to have interesting results :-)

Life is not this simple. Just because the stack pointer increased by
7 during the execution of this process does not necessarily mean we
only have to save 7 bytes. It is possible that the program pulled
5 bytes, then pushed 5 bytes, which may be different from the original
ones, then pushed 7 more. The only way to be sure is to compare all
256 bytes, but then it would be faster to just save them blindly.
(It is also possible that the program pushed 256+7 bytes, and while that
is not generally good programming practice, it may leave the program in
a perfectly usable state.)

There is a much bigger issue which has also been ignored: There is much
more to the state of an Atari 8-bit than the state of the CPU and stack.
Important information is kept in pages 0 and 2, and in the audio and
video hardware. If you do not preserve that across task switches, your
multi-tasking is restricted to a small subset of well-behaved (and not
terribly interesting) programs, which can not communicate with the
outside world.

OH, come on! I'm using Winblows '95 right now and I love it!

And the price of operating systems these days is relatively cheap.
Hell, you can pick up Warp for around $90. (I personally don't
like Warp for several reasons....One being that IBM really ripped
me off 3 years ago with a school computer purchase. As far as I'm
concerned, IBM is really gonna have to turn themselves around before
I'll be interested again.)

Well, I have looked everywhere and I can't find a program
I am looking for. Does anyone happen to know a still
functioning ftp site that has Ultima II and Ultima III available?

I can't seem to find it at UMich and Xmission. Also, clark.net and
the U Boston network keep on throwing me out of their ftp sites before
I can even get connected! Any help?

Also, I'm gonna ask a newbie question that I can't find an FAQ for.
How in the hell do I "flip to side 2" with Xformer 2.52? I've racked
my brains and all I can come up with is to concatenate the two xfd
files which would make the resulting file a virtual double density
disk. (Like MyDos45.atr.) Is there another program that I need to
accomplish this? Or have I overlooked the answer to this question
and many others with the FAQS I do have?

Well, any help for a Gumpite would be appreciated!

Source record: 91654

1) DON'T let your parents sell your 800. At LEAST have it sold or donated
to a good home.
2) With an 850 and a PC you can connect two modems or (I dunno how) a null
modem cable to do the transfering. The 850 can support up to 9600 I
think. 40K at 9600 is less than 3 minutes. 40K at 2400 is a bit over
4 minutes. 40K at 300 is almost 15 minutes. :)
ANYWAY, just borrow another modem from someone if you can or, as I said,
get or build a null-modem cable.
3) You can convert .DCM images into SIO2PC (and PC Xformer) .ATRs with
a PC program called "DCM2DSK".
4) You can download a lot of files (executables and .ARChives) and .DCMs via
the Internet and BBSes.
5) You can store files directly in .ATR disk images with S2PC for the PC.
It's not perfect, but should be completely fine for XFormer and, say,
DOS 2.0 or 2.5 or MyDOS 4.50 or 4.53. (BIG disk images choke, and I don't
think SpartaDOS images are supported.)
6) You can also copy files from the PC to an .ATR through Xformer by
doing something like: xf25 disk.atr file.bin Then under the DOS
you booted the Atari with which was in "disk.atr" you can Copy
"file.bin" from D2: (drive 2) onto D1: (drive one, "disk.atr").

I'm sure you knew quite a bit of this, but still..

Good luck! And I say again, HAVE that 800 sold or donated, NOT trashed!
Those are RARE! (relatively speaking) and can get more than a few bucks
(ie, $20-30 I think?)

: file for use with dos,ive got 5 that will work with basic only.

: --

Hello Michael,

I bought my 850 back in '81 with my Atari 800. Used it mainly
for printer connection back then. It has been sitting on my shelf
sind 1989. I recently dusted if off and currently use it to
transfer files to my Amiga machines. From there these go to my
brothers PC for use with the Xformer. Before you boot, you have
to switch on the 850 just like a disk drive. The 850 sits within
the daisy chain, and acts just like a disk drive as a bootable
device. Turn up the volume on your TV-set and you will hear the boot
tone (one longer high tone) before the disk transfer sound effects
upon bootup.

Hope this helps

Frank-Oliver

October 1, 1994 5th Annual Atlanta CoCoFest

Wittman Computer Products is proud to announce our upcoming release of a new OS-9 based computer. Running OS-9 V3.0, MGR a graphical environment interface, and utilize PC cards in its built in slots.

The product will be known as a WCP306 computer. It is based on a Motorola 68306 chip, specifications on other side. Due to current time constraints and other delays, we are unable to have a running demonstration of our product for the 5th Annual Atlanta CoCoFest.

Our target date to accept and fullfil orders will be the middle to end of June 1995. We are now accepting orders, with money down. The pricing of the machine will be:

WCP306 board only $400.00
includes OS-9 v3.0
& MGR

Desktop case w/ 200w ps $110.00
Midsize Tower case
w/ 200w ps $110.00

AT keyboard $ 30.00

VGA card 1024 x 768 1mb $ 75.00
SVGA card $ TBA
Monochrome card $ TBA

Teac floppy drives 3.5" $ 60.00
or 5.25" $ 65.00

Generic serial mouse $ 20.00
AT keyboard $ 30.00

SCSI and IDE hard drives are around $1.00 per Megabyte, call for current pricing and availability.

$400.00 for the base package below.

Single Board Computer with 16 bit PCAT I/O Bus WCP306

o MC68306 CPU at 16.67 MHz
- code compatible with 68000
- 2.4 MIPS
- 68681 DUART - 2 serial ports

- 16 Bit Timer/Counter
- 8 to 16 Bits Parallel I/O
- DRAM controller

o 0.5MB, 1MB, 2MB, 4MB, 8MB, 10MB or 16MB DRAM (4 SIMM sockets)

o IDE Hard Disk Interface (2 drives max)

o 1.44MB Floppy Interface (2 drives max)

o 2 16 byte FIFO serial ports (up to 115K baud)

o Bi-directional parallel port

o On board RS232 buffers

o Battery Backed Real Time Clock

o AT Keyboard Interface & Standard AT power connector

o 5 AT (16 bit) I/O slots

o Baby AT Size Footprint

o Basic (resembles Microsoft Basic)

o MGR - graphical windowing environment, full documentation!

o "Personal" OSK V3.0 (Industrial with RBF)
- MW Managers: SCF, RBF, PipeMan, RamDisk
- MW Utilities: date, deiniz, devs, dump, echo, and etc..
- PD (at least): dir/ls, cp, mv, arc, ar, tar, cpio, ...
- Development: At least an absolute (non-linking) assembler,

and perhaps an r68/l68 clone.

- Display drivers: Tseng 4K, generic inexpensive VGA
- SCSI card support: Future Domain 1680 & Adaptec AAH 15XX

o UUCP package from Bob Billson
o Ghostscript (PostScript interpreter)
o Scott McGee's File utility
o STerm (simple terminal program)

==========
More products to come in the next few months.

A printed catalog is available of our current products, feel free
to write to us for one.

Chicago CoCoFest 1995, we had a running WCP306. Hooked up to a
terminal and vga monitor with 4 virtual consoles running.

Sincerely,

William L. Wittman, Jr. - Owner

UUCP: swamps.roc.ny.us!MM1WNY!wlwjr

: We finally figured that one out. On the 6502 pin 34 is indeed the R/W,
: however, on the 6502c (that my atari apparently uses) it is pin 36, so
: Bob's advice in this matter was correct and I am a loser beyond belief.
: bjcorr@delphi.com

heller, yeah you are right the 'O' with a slash through it is the symbol for
'clock' and the number is the phase ....01 phase 1 clock (just as it comes from the osc) 02
phase 2,90degree or 180degree from phase 1....(which the atari is
180 degrees..) as for the 6502c yeah ben your right you have a 6502c in your
machine (and you have a xl/xe) the original 800 had a straight 6502 in it
the xl/xe has a custom version in it, it has a halt line that when it goes
active the cpu stops... when it goes inactive the cpu continues...

see what happens when you spend your teen years a computer geek using an atari?

From: bigrex@primenet
Message-ID: <3ph5h4$8db@news.primenet.com>
Source record: 91577

I downloaded X-former 2.52 and I've been having a ball with it playing old Atari-800 games. It doesn't however run all the software that I downloaded from X-mission. The stuff that I couldn't get running was. Zaxxon.com, DonkeyJR.exe, The 80 col Word processor sorry forgot the name. and more but none of the .exe files will run using load d2:xxxx.exe with dos 2.5 or mydos4.5d. Most of the boot XDF's run fine but, some want either the 800 or 800XL modes used.

Its been so long since I fooled around will my old 800 stuff. I sold it about a year ago and I could kick myself. Anyway can someone comment on the performance of X-former 3.0 . I'm using Win-95 beta on 486DX2 and have been able to run the 800 games in a window or full screen without any problems.

Yet ANOTHER killer program from off of the Top Magazin July 1992 disk!
(file: top9207b.dcm)

Not only does this disk contain:

Fax software
Oxygene (Uridium / Mirax Force action game)
LandScape demo (the one with the killer digital + sythnesized music)
and some other less impressive stuff..

but it contains "XL Friend", a program which lets you, at nearly any time,
pop up one (or all) of four useful little text-based windows:

(1) Note pad - a not-very-bad editor with, on my system, about 6K free
(2) Calculator - A non-signed integer-based calculator with add/sub/mul/div
along with memory
(3) Key pad (or something, can't see it's name when XLF.COM first loads,
it flew by too fast) - A program which lets you see what the value
is of the key you're hitting, as well as scroll through the entire
ATASCII set and get their values
(4) Hex dump - A window with memory in it.. go around, CHANGE memory,
etc.

They're killer little programs. The [Help] key brings up a temporary
help display at the bottom of the screen. The arrow keys (alone) scroll
through the windows (except in the note pad, as arrows without [Ctrl]
are useful keys: "*", "+", "=", "-") and the arrow keys with [Ctrl]
MOVE the windows around.

They overlay themselves as best as possible on a standard graphics 0 screen,
and it SEEMS any edit to memory via the Hex dump window has no effect until
you exit. As I said, you can be in a program such as SuperUnARC, pop up
a window, then another, then another, do some stuff to memory, then get
all the way back to SuperUnARC and it'll act as if you never left (even if
it was in the midst of a disk access!)

I even had to reboot twice (I tried running XL Friend with some incompatible
programs (it IS a "TSR"-like monster stuck in the wee little 64K we have))
AND THE NOTE-PAD WAS UNAFFECTED! (I don't know how.. it should have had
a lot more memory free if it were in a safe extended bank (I have 256k))..

It MIGHT still need 256k (perhaps it all sits in one of the extended banks,
but I have a feeling (especially from it's name "XL" vs. "XE") that it goes
in the under-the-OS bank.)

Anyway, enough babble.. go check it out! Cool little utility! :)

I'm probably not going to use it much, but I'm going to try it out under
Action! and maybe Quick and see if it's "happy" in those environments
(bet it dies under Quick, knowing those fancy European programs :)))

4238. Transferring programs to PC's

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-19 00:00:00 UTC
From: callum@hk.super.net
Message-ID: <3phjke$4s3@tst.hk.super.net>
Source record: 91581

Hi,
I've got the Atari 8 bit emulator (version 2 I think) but no games.
I have got a box full of original disks in my attic though. Is there
anyone out there who has figured out a way to transfer them onto the
PC? Alternatively, are any of the disk images available via FTP etc.
(I guess these things are still under copyright though even if some of
them are over ten years old).

Thanks,

Cal.

4239. STe & 8 bit Hardware For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-19 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <3pin5k$ddr@batph8.bnr.ca>
Source record: 91582
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale.computers.other.misc,misc.forsale.computers.other.systems

I have the following item for sale. I have not used them for quite some
time, so they are just sitting around collecting dust:

Individual Price
1. Atari MegaSTE System ($400)
- 16 mHz 68000 CPU
- 4 Megs RAM
- TOS 2.06
- 1.44 Meg Floppy
- External Keyboard
SC1224 Color Monitor ($85)
80 Meg Hard Drive System ($100)
- ICD ADSCSI+
- OMTI RLL Controller
- OMTI MFM Controller
- 40 Meg RLL Drive
- 40/23 Meg RLL/MFM Drive
- All above in standard PC case
- HD system has complete Mint+Mintnet configuration

Whole System for $500!

2. Spectre GCR 3.0
All original software included
All Mac disks I have
PRICE: $200, shipping included
(I know this is high, but that is because I don't REALLY want to sell
this, but I will sell at this price! With a new version of "the
product which was previously known as Spectre" on its way finally
(see Dave Small's recent posts), this may be something to hold on to.)

3. PC Ditto II
All original software & hardware & manuals
I got this to work once, but then I switched to a Mega STE so I
cannot use this board. I cannot guarentee it works.
PRICE: $50, you pay shipping

4. Atari 800XL 8 bit system
- Atari 800XL 64K computer
- 1050 "Happified" floppy drive, which needs works.
Drive light comes on, but motor does not spin. Should be easy to
get fixed.
- Okimate 10 Color printer
- Amdek composite monitor (I even hooked this to my AV receiver and
watched TV with it)

- Tons 'o software: games, word processors, games, graphics, games
(did I mention games?)

Whole system for $100! No splits on this one.

Send email to:

>upload to the Atari archive at umich. How do I do this AND ensure it gets
>to the mirrors. I don't want to post it to a mirror in case it doesn't get
>accepted to all the other mirrors, and umich kept timing out 'cos it was so
>slow. So, if you want some nice pictures of Ataris (I'm going to do some of my
>own, which should be better quality- this was a first go), I'll need some help
>on this. Thanks!

Months ago I planned a whole new Hardware section for my Atari 8-Bit Homepage.
Therefore I got loads of pictures from xmission.com and scanned in some of
my own. The project isn't really finished yet, but the more pictures, the
better. Anyway, all pictures I have are already available by ftp from:

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit/computer.images/big/ or
ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit/computer.images/small/

The small directory contains thumbnails of those in the big directory. If you
want to upload your scans, you can place them in:

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit/computer.images/incoming/

and I will see that they get in the right place. Send me an email if you
do so.

Source record: 91585

Hello!

I got an old printer for the Atari 800. Now I like to connect it to another computer. I found that the interface is not the Centronics standard. The printer has a 13-pin connector and a 13-line cable to the Atari. Who can tell me anything about this interface ? Pin-description, protocol,...

please email me : bernd@wema10.elektro.uni-wuppertal.de

Greetings to everybody

Bernd

4243. GameLink2 and 90 degree rotations

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-19 00:00:00 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2FBCA4EE@POST0.LAAFB.AF.MIL>
Source record: 91586

I have Maze of AGDAgon and it is awesome. I run it on two TV's and monitor. I bought the cable from Chuck. You can make your own cable with paperclips and SIO cables. The program came with instructions on how to do that. We had a nice review of it along with some words from Chuck Steinman.

Talk to Jeff Potter about programming for GameLink2. He worked on the effort as well.

The best 3-D maze game ever is WAYOUT! It has totally smooth turns (unlike AGDAgon). It is just super. I love doing the game with the paddle. If you haven't tried it that way, do it ASAP.

4244. Re: PC XFormer 3.01

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-19 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3pif28$lbn@nic-nac.CSU.net>
Source record: 91587

In AtariWriter, the PMG overlays are what makes the special characters black.
(In my game Sludge and in the game Tetrix (and many others), PMGs are used
to colorize Graphics 0 and Graphics 8 images, just like AtariWriter does).
Unfortunatelly, XFormer (the versions I've seen) can't hanlde this. :(

The PC has 320x200 graphics.. The Atari has normally up to 320x192 graphics,
but we've got overscanning. (Hence the Pageup/down keys scrolling in Xformer)

DLIs or something in XFormer seem messed up

4247. SIO2PC, 7400 version

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-19 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <138996@cup.portal.com>
Source record: 91590

```
All IBM pins refer to a 9 pin serial port.

ATARI 5------:-1 7 14-:--ATARI 10
:-2 4 13-:
IBM pin 2------3 L 12-:
ATARI 7------:-4 S 11 open
:-5 0 10-:--see below
IBM 9----------6 0 9-:
ATARI 4--------7 8--:<--ATARI 3
& IBM 5 1N914 diode

Pin 10---:-----/\/\/\/----IBM 3
_:_/ 1K
/ /\ 5.1V zener
:
GROUND

The colors I've found are
ATARI PIN
5 green
3 orange
7 violet =>cmd
6 black =>ground
10 blue =>5V

I've also tried it with a 4.7k pull-up resistor going from ATARI pin 3
to the +5V supply (like Nick did) & it didn't seem to change the
results.

1 2 3 4 5 2 4 6 8 10 12
6 7 8 9 1 3 5 7 9 11 13
View of the rear View of the SIO
of the DB-9F connector jack on the Atari

Just a few more notes, I've found pin 4 is a little more reliable of a
ground then pin 6. 4 is logic ground while 6 is shield ground,
shouldn't make a difference, but it has on occasion. One more thing;
since the inputs do not have a pullup or down resistor on them, you
should never leave the IBM side unplugged when you power up your
Atari. It could cause unwanted oscillation in the circuit. If you're
feeling really energetic, go ahead & add maybe a 100k resistor to
ground on the IBM inputs.
Richard: The magic in the thing is two fold. First the zener diode
limits the voltage on the 7400 to 5.1V when the IBM throws +9V at it.
Second, when the IBM puts out a -9V the zener becomes a regular diode
& forward conducts. This limits the voltage on the input to maybe a
```

-.4V which is just about the tolerance of the chip, but with the 1k resistor in line it's not a problem.
As far as RS232 specs go, one of my job duties was writing specs. It doesn't matter what the spec writters put down on paper, the engineers & manufactures do what ever the hell they want. In RS232 case even though the specs call for a minimum of +3V to -3V for logic level transition every device I've tested over the last 7 years responds to +5V to 0V. The only thing is you have to protect the device <zener/resistor> & invert the signal.
BTWI: I'm mostly using 74HC00 now so they should work with unmodified 1200XLs & whoever I was making one for in the UK, I finally finished the MAX232 version for you last night. I think this means I'm only running about 2 months behind a normal human being.
BTWII: Marlin, I really owe you a favor for having your BBS up all those years. I'd like to say I'll make you a cable, but my time is really iffy right now. You'd be better off going some other route if you're in a hurry. On the bright side, I just asked for a promotion/pay raise at work & if I don't get it I will have all the time in the world<g>.
Rick

MidiMaze/XE was the 8-bit version of MidiMaze for the ST; it
also had smooth turns, as well as multi-player combat (via modem).
Its display area was larger than Wayout's, and the screen update
rate was comparable to Wayout's, if not faster. The gameplay was
quite "live".

(Of course, MidiMaze/XE was never released, but I mention it here
so that people know that such a game is feasible.)

Yep, you're correct, I just checked. 12 V DC (11.5 is
marked on mine). The 12 V AC is for the MIO and it doesn't care.
A half dozen years ago I fixed one that had a 9 V AC brick connected
to it ONCE. The Connectors are identical.

From: sloopy@alaska.magpage.com
Message-ID: <3ph9v2$1i8@alterdial.UU.NET>
Source record: 91593

what you are looking for is a 'Rverter' it was made by supra it hooks to the SIO port and gives you a standard serial.....if you cant find one but can get access to a erprom prgrammer the atari SIO is basically a 9600 baud 8n1 serial line (but at TTL voltage levels and a command line) if you build a board to do the voltage conversion the rest is basically software....or if you like a challenge build the multi-PIA upgrade and sub a 6551 for a 6520, and put the support hardware on it...

sloopy.

Does anyone have the DiskComm conversion utility called DCM2DSK, to convert .DCM files to SIO2PC .ATR files? E-mail a UUencoded copy, if you can. It could really help, since I can't figure out the SIO2PC, don't have any Web access and I'm just using a null modem connection to send/receive files on my XE.

BTW: Anyone out there with the shareware of XFormer.. get it registered! It's a really great emulator.. my dad managed to pick it up at ACE 95 in Toronto for $30, and all I have to say is keep it up, Mike!

4258. Sparta Compatibility Problems

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-20 00:00:00 UTC
From: ehalliwe@emh.kunsan.af.mil
Message-ID: <9505211403.AA00744@emh.kunsan.af.mil>
Source record: 91506

The following is reposted with permission... lotsa good stuff in here!
This message is from John Picken to me, concerning FlickerTerm's Sparta-related problems. It has been slightly edited for relevancy.

..... BEGIN INCLUDED TEXT!!!!

From: ud264@freenet.victoria.bc.ca (Ted Skrecky)
To: ehalliwe@emh.kunsan.af.mil
Subject: JKP SPEAKS!
Reply-To: ud264@freenet.victoria.bc.ca
Status: RO

First, if your program runs correctly under MyDOS and is not using OS or extended (SDX) RAM, then your org is almost certainly not a problem. Memlo under MyDOS is considerably higher than with Sparta even after the addition of a RD handler and TD line. Sparta itself, does not use any RAM outside it's assigned ranges with the possible exception of calls to the floating point routines.

Rick's explanation of the usefulness of INITAD is 100% correct but a bit terse. You load a segment of code, load INITAD, do your first bit, and then repeat the sequence as often as you wish, using the same RAM if desired. I've written multi-segment COM files which work entirely in the printer and cassette buffers using the same technique and Sparta itself boots in this way. RUNAD is obviously less understood by many as I've seen people load it several times in a single file, eg.

```
*= $xxxx
INIT1
code
RTS
RUN1
code
RTS
*= RUNAD
.WORD RUN1,INIT1
; end segment
*= $xxxx
INIT2
code
RTS
RUN2
code
RTS
*= RUNAD
.WORD RUN2,INIT2
```

```
.END
```

The first segment will load, INIT1 will execute and return to DOS to load the next segment. Once loaded, INIT2 executes and returns to DOS to JMP (RUNAD) which points to RUN2. The code at RUN1 never gets executed. The above code could be replaced with the following and would execute identically:

```
*= $xxxx
INIT1
code
RTS
*= RUNAD
.WORD RUN2,INIT1
; end segment
*= $xxxx
INIT2
code
RTS
RUN2
code
RTS
*= INITAD
.WORD INIT2
.END
```

The point is, it doesn't matter when you load RUNAD, only what last value you stick into it. Whereas INITAD will always cause execution of the code pointed to as soon as the vector is loaded. DOS checks INITAD for (usually) a non-zero value after each load segment.

Sparta always handles INITAD correctly but seems to ignore RUNAD and prefer to jump to the load address of the first byte of the file. So the guy who mentioned using an RTS as the first byte and INITAD to point past it was on track. With my own files, I generally use LDA #$60 and STA START as the first ops of the final run code. Either technique fixes a problem you run into with Sparta: a tendency to rerun the same file after an RTS. This can usually be cured by a JMP (DOSVEC) exit but ensuring an RTS at the original org adds safety.

I puzzled over the same exit problem you encountered and came up with the same solution, exit via JMP when working under Sparta. It's taken a lot of disassembly and head scratching but I think I know the reason: Sparta installs a custom E: Get Byte routine for its command line interface. On boot or reset, it copies the OS device table into DOS, points HATABS to the copy and replaces the Get vector with its own.

Any program which closes and opens the E: device will toast the address in HATABS as the OS will point it back into ROM. Obviously a JMP (DOSINI) or JMP (DOSVEC) will fix it as DOS would always have to reset things after exiting BASIC, TextPro, etc. while a RTS leaves DOS looking for input from the wrong code and buffer address.

Generally, I find it simplest to use a standard programming format for
all programs designed to run under any DOS:

```
*= $xxxx
INIT1
;
; intro blurb, etc.
;
RTS
;
*= INITAD
.WORD INIT1
;
*= $yyyy
INIT2
;
; real init stuff, syntax, etc.
;
RTS
;
*= INITAD
.WORD INIT2
;
*= $zzzz
RUNIT
LDA #$60 Insert an RTS at the
STA $xxxx file's original org.
;
; Code to identify dos and set a flag
; for exit and other uses such as
; accessing Sparta's OS RAM vectors
;
MAIN
;
; Code to nuke Intels, Tramiels, etc.
;
EXIT
LDA DOSFLAG
BEQ XSPARTA
RTS
;
XSPARTA
JMP (DOSVEC)
;
*= INITAD Use this for non-Sparta
.WORD RUNIT compatibility
```

Use of INITAD for the final run address allows the program to be appended
in an autorun for any DOS while stuffing an RTS into the first byte
ensures that when Sparta attempts to rerun it, it's harmless. Under
Sparta, the JMP (DOSVEC) will not terminate a batch file, DOSINI
probably does. Under most other DOS a JMP (DOSVEC) would send you to

DUP.SYS while going through DOSINI would take you to an RTS.

You can safely, and probably should, use the JMP exit with BW-DOS and DOSXL as many of their COMs work correctly under Sparta. Note that any DOS I've ever looked at, always stuffs $FF into the stack pointer when you call it via DOSVEC so you can ignore the stack.

To date, I have found none of the foregoing to be inapplicable with SDX.

I haven't gone heavily into identifying other DOS types but:

a. the Sparta manual mentions that many COMTAB offsets apply to DXL which might help differentiate it from DOS 2;

b. BW-DOS will look like Sparta 3.2d in $700-$701 but $703-$704 will be ASCII "BW";

c. the first (12 I think, 10 at least) bytes of Sparta 2.3 consist of a jump table of addresses on page 7 in .word order;

d. with Sparta 3.2+ I've been using SMEMLO (COMTAB+30) to pick up 3.2g; any 3.2 except "g" will have an msb of $18, "g" will be $17 (only matters if you're worried about D9:)

I hope this helps as I'm looking forward (once I get a new pair of glasses) to Flick80 with a capture buffer.

Best wishes
John Picken

Also, The Crash happened. The 1450XLD was displayed at the Summer 1983
(?) CES. That CES probably had more "orphan" machines than any other CES.

DCM2DSK is available via FTP (or BART e-mail server or Gopher) at UMich. If you have Gopher access, use it. If you have FTP access, use it. If you just have e-mail / Usenet news, you're stuck relying on one of us or on the UMICH BART e-mail server.

The FTP address is: atari.archive.umich.edu amiga.archive.umich.edu works well, too, except it acts funny when you do "cd". Also, it's much more available than "atari" and the other ports into UMich. ALSO, there are mirrors!

The Gopher address is: gopher.archive.umich.edu Under "Merit Archives"

From either of those, go to "atari" then to "8bit" and finally to "Sio2pc". The file is "dcm2dsk2.zip". Actually, forget that, I'll e-mail it to you, but from now on, don't rely on us! Rely on the facilities available!! :)

And one more thing- Darek Mihocka is the author of PC Xformer (and the standard retail price is about $30), unless you really meant "Mike."

Whoa! Haven't you heard of the APAC/COLOR/J-VIEW array of programs from Jeff Potter? These will convert .GIF files to GR.8,9, & 15 as well as special software programming that presents up to 4096 colors (depending on the original .GIF).

Part of the problem was that all values were single-precision. There
was no integer data type in ATARI Basic. Any float operation was bound
to be slower than an integer type. The float used the OS FP routines,
not the fastest in the world.

Did you see the values for the Atari version of Microsoft Basic? Definately
faster. And of course there was Basic XL...

Let's just say that it all started with the Atari 2600, went on to the Atari 8-bit computers, to the Commodores, to the Sega Masters Systems, to the Amigas, to the Atari STs, and to the Sega Genesises..

The only major differences in compatibility that I know of are the new Sega 6-button controllers which you can't use on some games, and which require you to use the "mode" button they have to be able to run them on quite a few older games...

So, if you can use it on a Sega, you can use it on ANY of the other machines (at least when it comes to joysticks).

If you can use it on an Atari 2600, you can use it with ANY of the other machines (except the Sega, unless you're playing Sonic the Hedgehog, where all three buttons are "jump" :))

4272. ICD carts

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-20 00:00:00 UTC
From: James King <jeking7@delphi.com>
Message-ID: <50ycrtt.jeking7@delphi.com>
Source record: 91601

Just out of curiosity, how many of you have carts (ICD, CSS, etc..)
plugged into your 8bit that require a rubber band to keep the two
halves together?

Sold an Rtime8 to a fellow who is completely complaining because I mailed
him an R8 that had a rubber band wrapped around it. Offered to refund
his paltry $25.00 and he refused, but continued to fire off mail messages
about how I "deceived" him on the condition of the Rtime8.

I dont know about you folks, but if I were THAT dissatisfied, I'd take
the time to mail the cart back (less than $2.00 to ship) and get my
money back.

I know for a fact that CSS mails off their MUX carts with a rubber
band holding the two shells together, and that at least %60 of the
carts I've purchased have come in that condition as well.

Is it just me - or is it unusual to find an ICD carts in that condition?
Especially considering that R8's need to be opened periodically to
replace the battery or increase/decrease the clock speed.

Any feedback on this thread appreciated.. I'm tired of this idiot ranting
at me in mail. Wont post who it is - but YOU know who you are! SHEESH!

Greetings,

I've recently come across a 64k atr8000. However the original
cpm disk and cpm manual are long gone along with the original owner. The
person who bought this persons other ATR, got two cpm disks but only sent
me a terminal disk but no cpm.

I need to get a copy of the cpm manual or a photocopy and I'm
willing to pay the cost of copying & mailing. I need the cpm disk as
well, I'd prefer to download a discommed file if possible.

Thanx,
James

Just a quick note of caution: Do NOT try to use
LUN 7. This is reserved for the Originaltor, meaning the
BlackBox or MIO or whatever you are using for a SCSI
Interface. It is always 7.

The problem with those benchmark tests was explored by Bill
Wilkinson in one of his Insight: Atari columns for Compute!. Essentially,
the problem is that the program used to benchmark is the same for all of
them. While this seems fair on the surface, each computer does certain
things in certain ways better than other computers and/or languages.
Thus, a given program is bound to run faster on one computer than
on others, because it will be somewhat more of an optimal listing for
one than for others.
Bill wrote a program that did the same thing as Compute!'s benchmark
program, but optimized it for the Atari, and ended up with faster times
than those for the IBM PC. Of course, it can be argued that, if the
program were optimized to take advantage of the IBM Pc's strong points,
it too might have a faster benchmark time.
The bottom line is, benchmark tests are inherently flawed. They
are worthless for purposes of comparison to see which interpreter/computer/
compiler is the fastest.

4280. Buyer Be Wary: JEKING7@delphi.com

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-21 00:00:00 UTC
From: steveg@phantom.com
Message-ID: <3pmgmu$elo@dockmaster.phantom.com>
Source record: 91523

A make-your-own-opinion "warning":

I recently purchased an RTime cartridge from JEKING7@delphi.com. When we were negotiating price/etc, I was told that the cartridge was in "good condition". I paid the price ($25) and, over a week later, got the cartridge.

My first observation was that the cartridge was being held together with a rubber band. This was a bit depressing as I don't consider a rubber band repair to be indicative of "good condition". After telling him this in mail, I was told that (in essence) "all RTime cartridges" are like this. He also went on to tell me that I should be happy; when he bought the cartidge, he had to solder in a new battery holder to make it work.

I asked him what his rationale was. He had told me the cartridge was in "good condition", yet it was home-solder-repaired and held together with a rubber band (and a prayer, presumably). The response I got back from him was less than positive, loaded with vile language with a heavy "in your face" attitude. (That's when I got fed up with his attitude and told him he was a real fucking asshole.)

To his credit, be did offer to refund my money. As I've had a hard time finding one of these cartridges and I didn't want to be stiffed for the shipping (not to mention that considering his generally negative attitude, I sincerely doubted I'd see my money back anyway), I declined, noting that I hoped the cartridge actually worked (my 8-bit is in NJ, I'm in NY and won't have a chance to try it out until next weekend).

So that's it. If anyone decides to deal with this person, please be sure you know _exactly_ what you're buying. His definition of "good condition" is, IMO, quite different from what everyone else's definition is.

No eprom is necessary. All you need is the voltage conversion and
some tri-state logic. There's a file at the umich archive (in the
Modifications directory, I think) called atserial, which describes how
to build an Rverter-compatible interface.

4285. WTB: game carts/disk collections for Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-21 00:00:00 UTC
From: dduck@diku.dk
Message-ID: <3po5m0$jl3@odin.diku.dk>
Source record: 91528

Hello all!

I've just aquired an old Atari 800, which turns out to have become my primary games machine. I'd like to get more games for it, but there are some problems.

1) I live in Denmark, and the Atari 8-bits never really took off here.

2) Buying individual carts has HUGE monetary overhead. I'll have to pay shipping, exchange etc. which comes to at least 10$ pr. cart (!)

So, what I'd like to buy is collections, so as not to pay too much overhead. As the danish currency (Kroner) is currently strong, I'll be able to pay a good price.

Please send me offers here, or email me as dduck@diku.dk

It sounds like you may be getting "good" confused with "mint" when it comes to a product's condition.

If it doesn't WORK, then (unless the P.O. boo-booed) he's at fault for saying "good." But, looking at the one super cartridge I have (Diamond GOS), it looks like they aren't the best built things, ESPECIALLY considering you have to.. you're SUPPOSED to open them (RT8's).

Not to stick up for James or anything. :) I mean, I didn't see what he wrote you.. I'm sure if he used vile language, you have all the right to be p.o.'d at him.

Steve,

If it makes you feel better... I'll send you some "brand new"
plastic cases so that you won't need to rubber-band the R-Time 8 together.
Just E-Mail me with your mailing address, and I'll get to it as soon as I
can. $25 is a good price, and things shouldn't get out of hand over something
as silly as some cartridge plastic. (The cases tend to do that when they've
been opened a couple times, and obviously in Jims case the battery needed
to be changed.)

Take care, Mike (FTe)

4289. WTB: Atari 130XE in good condition.

Source record: 91533

If anyone has any ideas on why my friend's 130XE died on him, it would be greatly appreciated. When the power is turned on the screen turns green and then freezes. He thinks it may have been "fryed" in an electrical storm but not sure. What is a fair price to pay to get it fixed?

Also, if anyone has knowledge of common malfunctions or failures on the 130XE, it might be of help.

Thanks in advance for your help,
John

Steve, you know what it really sounds like is just a matter of different interpretations of 'good condition'. It's something we are all going to have to deal with as stuff ages. Eventually I think 'good' is liable to slip all the way to mean 'it works sometimes'. I frequently repair an 8 bit or two & it seems like just about everyone is showing the signs of oxidation. Maybe this should be added to the FAQ. Something like:
busted
shaky=>it seems to be trying to work
good=>it works fine but not cosmetically perfect
excellent=>works fine & looks new
Busted speaks for itself. At least thing we'd all be on a level playing field.

Steve G. <steveg@phantom.com> writes:

>So that's it. If anyone decides to deal with this person, please be sure
>you know _exactly_ what you're buying. His definition of "good condition"

Wel, that ("please be sure you know _exactly_ what you're buying)
is a good policy no matter WHO you are dealing with, especially if the
transaction takes place in such a fashion that you can't see the
merchandise until it's "too late".
F'rinstance, if I'd been buying that RT8 cart, and asked the
condition, I'd have assumed "good condition" meant it was in working order,
with only minor cosmetic damage. That's MY definition of "good condition".
But, in dealing with folks on the 'net, I've found that my definition isn't
everyone else's definition. I've gotten Traveller (a role-playing game,
now out of print for 8 years) material that was stated as being in
"good condition" that had ripped covers, writing (in pen!) on the pages,
etc.
I chalked that up to experience, and now I always ask for specifics
on everything I buy that is of importance to me.
I suggest you treat your experience similarly. I seriously doubt
James King was trying to defraud you. His definition of "good condition"
and yours were just different.
In short, define your terms before you make the sale. :)

At least for schematics, there's an old <~6 years?> DDJ article on an auto router that did it all with just 30 or so redefined characters on an IBM. A few years later I duplicated most of the character set on the Atari & loaded it into my own playfield editor. It seemed to work fine for some simple schematics I tested it on, matter of fact, I was thinking about writing a simple schematic program for my own use, but after I hit on this combination I abandoned it. The 8 bit was a little more limited then the DDJ article, something like a max of 2 traces per character vs 3 for the IBM, but I think with my editor I could do a max of 28 pin devices. The disk with the character set went south, but it wouldn't be that hard to duplicate. The resulting screens look like my ASCII schematics I post from time to time. If anyone is really interested in this application for passing schematics around let me know & I should be able to duplicate a cheesy effort in a couple of months.

> ....

Believe it or not, you're (probably) lucky if the problem is indeed with the ribbon/
slot connection. XEs are notorious for keyboard problems--they where very cheaply
made, especially the early ones (at least Atari CLAIMED to have improved them
later). Ironically, though, I prefer the "feel" of the XE keyboard over any other
computer I've ever used. Usually, the problem was dust getting into individual
key contacts, and/or the carbon contact for an individual key wearing out. To
fiddle with either of these problems required removing the approx. 20 (!!) tiny screws
on back of the keyboard unit. On my 3rd or 4th time around on this with my first
130XE I finally threw up my hands and paid the $20 for a new keyboard.

Don't take my suggestions as gospel, but I wouldn't worry too much about what you
try on the slot cleaning, as long as it is not likely to be TOO destructive or abrasive; or
in the case of cleaner fluids not likely to short out the connection. There are at least a
couple of Radio Shack cleaning sprays--I had trouble with the one labelled "Tuner
Cleaner", because the lubricant it included in it tended to short things out if I didn't
scrupulously wipe it off of what I used it on. Just take reasonable care and work your
way up from very fine abrasives.

Before you go at it, however, you might try building up the back of the connector with
something like tape to add pressure against the contacts on the other side (that is, if
it is a one-sided ribbon connector, as I recall). Or, if your little foil wedges make it
work,
why not redo them carefully and see how long that keeps you going?

The thing is - the Rtime8 I sold this guy works perfectly, now has a clipped in, soldered in battery (when I got the Rtime8, the battery was held in with electrical tape).

The only flaw was that the pins holding the cart together were broken (due to it being opened up a couple times) - and had a rubber band wrapped out to to keep it together.

It's just unreal to me - that even after multiple offers of a refund, this moron has the gall to post such a slanderous message on CSA8!

He, J. King, is correct. Good condition IS if it still HAS the
case. Never mind that it is held together with a rubber band. I've
had to replace the batteries in many of them and with almost everyone,
I've had to use a rubber band to hold them together after openning
them once.

4308. 1050 help!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-22 00:00:00 UTC
From: <>
Message-ID: <3pp4fu$8ao@stud.Direct.CA>
Source record: 91543

I just pulled my 8bit out of the closet and i'm now reliving some of the fun of simpler days. 8-] I got a second 1050 drive from a local thrift store for $5 and i can't remember how to set the switches in the back so that the computer sees it as a second drive. Can anyone out there look this up and reply to this message here? My e-mail program is really screwed up so if you reply by e-mail i won't get it.

Thanks a lot. 8-]

I don't know what xmission is. But one of the places i ftp software for the 8bit is.

src.doc.ic.ac.uk /pub/computing/systems/umich/8bit

You should find all you need there. In fact i'm ftping as i write this. My other computer is a fast pc system running os/2. Kinda neat multitasking a telephone line!

SG>
SG>I asked him what his rationale was. He had told me the cartridge was in
SG>"good condition", yet it was home-solder-repaired and held together with a
SG>rubber band (and a prayer, presumably). The response I got back from him

I don't think it is all Jame's fault either. I have an SDX cart. that
I originally bought new from ICD and have taken very good care of, but it
doesn't take very much to get it to come apart. I haven't taken it completely
apart but I imagine that taking the Rtime8 apart to solder in a new battery
would not help the case a bit. ICD could have come up with something a
little bit more durable. Too bad it wasn't something along the lines of
the early Atari carts (metal and a philips head screw)...

: OK, how about the other direction?
: (I know, I'm just never satisfied :-)

JVIEW, by Jeff Potter converts any GIF into .R .G .B files, or into
single Gr.8/9/15 files, or even into ColrSquashView RGB compacted files
(the first and third are for 64-color and 4096-color modes).

It also displays the GIFs in any of the above modes.
(That is: Gr.8/9/15 with mutli-color on or off for each.)

Satsfied? (:

If it's already set to be drive 1, just move the switch you can see to
the other position. (Sorry I don't remember the specifics.)

A few years ago, I created a program to read, display, and print out certain TIFF files (notably bilevel line diagrams). I predictably named it TIFFREAD, but I never distributed it. If you could, please email a UUEncoded (small, <50K) file to my CIS address, and I'll see if it still works, with your flavor of TIFFs.

From: aj445@cleveland.Freenet.Edu
Message-ID: <3psch3$501@usenet.INS.CWRU.Edu>
Source record: 91464

I have the following Atari 8 Bit items for sale to the highest offer. I would naturally prefer that the interested parties be within driving distance, so that they could actually SEE and operate any system that they are interested in (I'm in N.E. Ohio). However, I realize that that would be severely limiting the pool of prospective buyers. Be assured that all items are in perfect working order. All memory upgrades were done by myself, as well as any mods and normal maintenance. This is a shortened list, as many of the original items are no longer available.

Atari 130xe (320k) SuperVideo 2.1
Atari 1200xl (1meg) SuperVideo 2.1
Atari 600xl (64k) SuperVideo 2.1
Atari XEGS (128k)
Atari 800 (48k)
Atari 800 (188k)
Percom SS/DD disk driv
Atari 810 disk drive (Happy enhanced)
Avatex 1200 baud modem
Basic XE cart.
Commodore 1802 monitor

I will personally check out any item prior to shipment. I'm a Sr. Electronic technician, and hold an Extra Class FCC Amateur Radio license. These items were well cared for. As mentioned, I'd prefer a local buyer, but I will ship to continental U.S. locales. If you are SERIOUSLY interested in any item, you may contact me at:

aj445@po.cwru.edu
cooncat@ix.netcom.com
kb8eb@wa8bxn.#neoh.oh.usa.na (packet radio)

Source record: 91469

.DCM files, like .XFD and .ATR files, are disk images. There's a big difference between .DCMs and the other two (other than that it is much older, more standard, and the _official_ Atari disk image format).

Atarians without PC's need to get DiskCommunicator 3.2, the program which makes and extracts .DCM files.

Atarians with PC's (either running Xformer or SIO2PC) need to get (to save themselves from HOURS of annoyance) DCM2DSK for their PC. It converts .DCMs into .ATRs.

And finally, Atarians with PCs who are using only SIO2PC, not Xformer, and are trying to get .XFDs up and running should load up QBASIC and prepend the 1st 16 bytes out of a standard Single Density (90K) .ATR onto the beginning of the .XFD. (The data format is identical, but ATRs are more versitile since they have a header; THEY can be from 128bytes to 16MBs in size!)

DCM2DSK (dcm2dsk2.zip) is available both at xmission and UMich near SIO2PC and/or Xformer.

Just trying to get some info on any HD setup for the 8 bit system that was or is out there. I was told that there was a setup for the old Atari to run a system of a HD and tape backup system. But do not know of this system. I heard of the MIO, but it is not the samething as the one that was mentioned to me back awhile ago. If anyone know of this please leave me a message with the correct info. Thanks.

[Much deleted]

Are the old magazines worth anywhere near what Steve is asking?

I just dumped a bunch of old Analogs and Antics because I figured
it would cost more to ship them than people would be willing to
pay. I still have several years though, so if you are interested in
old Atari magazines, email me and I'll tell you what I have.

James; you can relax. We've all known you for years, Steve's difference of opinion with you and harsh tone of his message has in no way influenced my opinion of you. I doubt if it's had an impact on anyone else other then establishing what you mean by good condition. If anybody bought an R-time cart in 'good' condition we would certainly know what we'd be getting by now with all the multiple posts describing in exacting detail the condition of cart in question<g>. Just ignore it & it will go away as another non event in comp.sys.atari.8bit. You've probably done a couple of dozen deals over the net, this is the 1st time I've ever seen a complaint so I know at least 95% of the time people are happy dealing with you. That's a pretty fine record.
Rick

4335. 130XE keyboard woes

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-23 00:00:00 UTC
From: gederek@sdrc.com
Message-ID: <3prbae$92j@info1.sdrc.com>
Source record: 91478

Hi!

I recently bought a 130XE at a garage sale. To my dismay, it has a problem with its keyboard - the 2,w,s, and x keys do not work, nor do the function keys along the top of the keyboard.

After a bit of tinkering, I've concluded that both the keyboard and computer are perfectly fine, and that there are two contacts out of the 24 on the ribbon interface that are not making good contact when slotted into the computer board. I've been able to take wadded pieces of aluminum foil and wedge them between these two contacts and the contacts on the slot, and the keyboard works fine.

My problem, then, is what to do to acheive good contact for these two lines. I've cleaned the ribbon contacts with both alcohol and a baking soda/water mixture, without success. There's no visible signs of dirt or damage to the ribbon, so I'm thinking that the contacts in the slot must be dirty.

So now, the big question, how do I clean the contacts down inside the slot? I've got two ideas - compressed air (which would run approx $10) and some spray cleaner that Radio Shack sells ($15). Has anyone out there had similar experiences? I'd like to get a good idea of what has worked for others before I start dropping more dough on this thing. Any input would be greatly appreciated. Thanks!!

Hi,

"I am looking for ALL, OLDER (NON-NINTENDO/SEGA) VIDEOGAME CARTRIDGES and
HOME VIDEOGAME SYSTEMS.. HOPEFULLY the thought of tossing out these poor
little things hasn't crossed your mind!" <aaack!> =(

*Like These:

-ATARI: 2600/5200/7800
-COLECOVISION
-INTELLIVISION
-ODYSSEY
-VECTREX
-ATARI COMPUTER (cartridges)
-COMMODORE 64/128 (cartridges)
-APF
-BALLY ASTROCADE
-EMERSON ARCADIA
-FAIRCHILD "CHANNEL F"
-MICROVISION
-RCA STUDIO II
-SPECTRAVISION
-ANY OTHER WEIRD SYSTEMS
NOT ON THIS LIST..

"What do I do, Chris?"
(Please read the following carefully..)

1.) Please send an EMAIL-LIST of what you have, ie. TYPE of system(s),
HOW MANY cartridges? the cartridge NAMES.. Do they include BOXES,
MANUALS, OVERLAYS, GAME PIECES, etc? Please include CONDITION of
the items (working?)

2.) Sorry, I am not looking to pay exorbitant amounts for items, garage
sale and thrift shop prices at the most, But if you have any doubts,
please still contact me..

3.) Please be willing to sell INDIVIDUAL COMPONENTS (cartridges, etc),
I don't always need everything! =) But, if the price is right, I WILL
buy the collection..

4.) Please Check your E-mail OFTEN for replies and other
arrangements, I check and respond to mine daily/nightly..

5.) I PREFER to buy within PORTLAND, OREGON and other close-in areas, but will travel short distances..

*Besides Email, I can ALSO be reached at (503)297-6568 (if not there, please leave a message)..

*"Games? What Games?
I Don't Need No
Stinking games!!"

-Chris.. =)

>anyone else have this problem? Is this a manufacturing mistake? If not,

Hi Rich,

Believe it or not... It was intentional!

When the prices of ROMS dropped and everyone was just putting 16K into
the left slot, Atari decided to drop the right cartridge connector because
of lack of "Right Cartridges" (except for Monkey Wrench, Austin Franklin 80,
and the R-Time 8's that I know of) due to the fact that it was being used
with software to "duplicate the carts". My first 800 was the same way,
and it's really easy to just solder in the edge card socket...

Hope this helps, Mike

(Gees, I forgot. Somebody talking about 130xe keyboard.)
I suspect the problem is not the contacts in the connector on the
mother board, but the 'etching' or painted conductor, on the mylar
(some kind of plastic Ben Poehland would know exactly.) I had a
similar problem. Found these neat little mylar strips with thin metal
'pins' or almost little tiny knives on each end. I cut off the plastic
that fed into the connector, stuck some cut off pieces of these strips
(the strips have 20 'pins', the connector is 24, so I use 4 strips of
6. The 'knives' push up between the plastic coating and the plastic
that has the 'etched' lines on them. The other side just sorta 'plugs'
into the strip connector. I made a 'clamp' to make the pins stuffed
into the plastic tight and haven't had a problem. These 'strips' were
found at a surplus electronics store for about $1 apiece.

(R.G. responds to R.G. responding to Darek Muktarian about 130xe keyboards.) ((Muktarian? Is that anything like an Atarian?)):)<---
Oh, yes. If your functions keys aren't working, you probably should get a new keyboard (ATV has 'em and maybe B&C and Best). The things I called 'etchings' or painted on conductor gets oxidized and/or the rubber 'cups' or 'footies' get oxidized or both and I don't think even a new 'mylar' is good, or maybe a new set of 'rubbers'. Better yet, I think you can still get a 'transkey', which allows you to hook up a standard IBM keyboard to some a8s, maybe even the 130xe.

There is an information in the XLF documentation that it uses RAM
banks from under ROM (so it will not work e.g with Turbo Basic XL) and quite
smart way of initialization to restore information that has been stored
in the notepad before reset.

Btw. as I know XL Friend is a part of Quick Assembler Package together with
Bug Hunter (very nice debuger for Atari XL/XE) so I am not sure whether it
can be distributed free :) .

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <139255@cup.portal.com>
Source record: 91407

As far as the faster times go for different flavors of Atari, the OS was rewritten so some problems with the screen routines were straightened out. I believe they were specifically the screen scroll & screen clear code. If you ran the same test with no screen I/O you probably wouldn't see a difference. As far as the rest of the test go, I never underestimate the power of a rigged demo to show exactly what you want it to show. For instance, if Atari would have adopted the Fast FP routines that are in the Newell ROMs all the test would have been about 30% faster. I'd bet they just figured FP is not used by your average PAC MAN clone so they left it alone. Another author who fooled around with Atari basic was Bill Broderstein<sp?>. He redid the way Basic searches for line numbers & I think at least one or two other hacks like fast screen scrolling to speed it up. The tradeoff was you lose some of the reasons why you use Atari Basic over others in the first place. Bill Wilkinson mentioned a few of these in his column, simple stuff like being able to press the BREAK key then type CONT to restart your program. Hitting reset & having your program still there, try that on an [ST, IBM, ...]. Atari Basic saves a lot of variables & lists so it can do this, that takes time.

Body handling: HTML body converted to readable text

PC: Just a guess, but probably a good one. Xmodem as it is implemented
on an Atari fills the last bytes of the final block with characters.
I'd bet that's what you may be picking up but it is a little suspect.
I forgot how these bytes are encoded to pad out the 128 byte block, but
I thought it was something like:
Let's say you have 65 real data bytes as the last 128 byte Xmodem block,
it would be sent as [65 data bytes, 63 'A'] followed by checksum/acks.
If it had 67 data bytes it would be [67 data bytes, 61 'C's]. It's non
standard on the Atari & I've seen this show up on some lame-o transfer
programs I did when I mixed other computers with the Atari, they weren't
expecting a non-standard terminating block or were just done wrong on
the other equipment so they saved the entire final block. Once it got
in the file, it was there to stay unless I wanted to get down & dirty like
you're doing.
BTW: These files should *NOT* run reliably on an 8 bit except by pure chance.
Well, if the last bytes of the real code are RUN vs INIT they shouldn't
anyway. You & the guy who posted the accurate description of RUN/INIT
vectors have it right with the following addendum. After every block of
a file is loaded INIT address is checked to see if it has changed &
now contains an INIT vector. The RUN vector isn't checked until EOF. With
the files your found DOS will never check for a RUN address since there
are more bytes in the file. DOS now assumes the next 4 byte are
more load addresses. In the 'A' example DOS would start loading the
appended bytes at 65+256*65. If the computer survives this, DOS will
then go through RUN vector.

First time post in here people, so keep calm...:-)

Been looking some help if thats OK with you guys...

My current machine is an Amiga (back off PC owners) and so far all I can find
Netwise is PC extractors/compressors etc. So shure I can get the files but cant
do a thing with them...Are there any Amiga -> Atari proggys about??
I do have a 850 , but dont have the connection details otherwise I would port
the files down.

2nd and last query (and most stupid) What are the file formats that are used
on the sites. IE what progs will I need for the Atari side for extacting the files
.
Simple to you guys, But Im used to playing/programming direct on the machine
So now that I can see a few new (?) bits of software I want to get at em..

Hope You all can help, Machine wise (8bit) I can hold my own with most, but
seeing those great old games as .XDMs(?) etc on my HD and not knowing how
to get them off is Killing me...

I was curious as to how one would hook up an Atari 800xl to an external modem? I have an Avatex 1200hc which I borrowed from my school and I'd like to use it with my 8-bit system. Is there something that goes into the cartridge slot or does it "daisy chain" to the system like the drives? What sort of interface would I need to hook it up?

You'd need an Atari 850 interface, which allows you to hook all sorts of
stuff up to the classic 8-bits. I'm looking for one of these myself...but
they aren't all that hard to find.

Is there anybody who can tell me something about the serial bus of the
Atari 800? I knew already that the baudrate is 19200 I knew the pinout of
the connector and that it works with TTL level. The most important information
I need now is the software-protocol.

Greetings to everybody

bernd

4354. secret stuff INSIDE the 800!

I opened up my Atari 800 a few days ago, and found lots of interesting stuff! Did you know that there is a 4 slot expansion card area underneath the hood? Also, there is a WIDE card interface on the back of the motherboard...probably meant for an expansion that Atari never meant to use...almost like enginerring snuck it in and didn't tell anyone. Also, the CPU is mounted on an expansion card! I also discovered some MONSTER sized capacitors inside...what would they need those for? They also used a TON of aluminum in it also. I think this system was very well designed for its time period.

Look at the previous messages "Re: 130XE Keyboard Woes"
More than likely the connector is not the problem, but rather somewhere on
the mylar there is an open foil. If you have the skill to take the keyboard
apart and locate the open, it can be fixed. I've used a special 'Paint' made
by Locktite that is for repairing the electric rear window defrosters of cars.
It's sold in Automotive stores and is not cheap. Around $12 for .05 oz.
Locate and paint the open or crack in the foil with this 'Stuff', wait a
little bit and then use a tootpick to clean between the foils so there are
no shorts. The paint 'runs' alot. I've fixed at least a dozen XL and XE
keyboards with this stuff. I'm on my second bottle in 6 years.
Another thing I just ran into last week. The foils that actually
contact the connector were plain worn out. Used a sissors to snip off
about 3/16" from the mylar. 800XL keyboard works fine now. Be
careful, make a god straight cut.

>I opened up my Atari 800 a few days ago, and found lots of interesting stuff!
>Did you know that there is a 4 slot expansion card area underneath the hood?

Not really a secret, there were several add on cards. But, using Atari hardware limited its use (OS/CPU card and 3 16K RAM cards filled them), did they combine them into one 48K card in the later days?

Anyway, 32K cards from 3rd parties came out. People filled the now unused slot with 80-column video cards and extra RAM and RAM disks.

>Also, there is a WIDE card interface on the back of the motherboard...probably
>meant for an expansion that Atari never meant to use...almost like enginerring
>snuck it in and didn't tell anyone.

Just for testing, never meant for use. I have read Atari planned a parallel interface for faster disk access, but FCC certification made it too hard to add. Is this a remnant of those plans?

>Also, the CPU is mounted on an expansion card! I also discovered some MONSTER
>sized capacitors inside...what would they need those for?

The power supply sends the computer AC, I assume you're looking at the "power supply board" (right side, from the front), most computer's PSs do the AC/DC conversion. Why was Atari different.

I have an article titled "Anatomy of an Atari" from Antic with some details.

4361. Re: Buyer Be Wary: JEKING7@delphi.com

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-24 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <5E--EoV.lmcclure@delphi.com>
Source record: 91420

In a message dated 5-22-95, James King said:

It's just unreal to me - that even after multiple offers of
a refund, this moron has the gall to post such a slanderous
message on CSA8!"

By definition, slander is a *falsehood* that damages one's reputation.
After reviewing the message in question, I do not see anything that you
have not confirmed yourself; the fellow even went so far as to note that
you offered a refund (and stated the reasons he declined).

The only part that might be in question is the conversation between he
and you, as we did not witness that. As an example, the part where
Steve G. said:

"The response I got back from him was less than positive,
loaded with vile language with a heavy "in your face"
attitude."

I would have put the benefit of the doubt in your favor on this point,
except that in your message, you end with calling the guy a moron,
which lends credibility to his statement quoted above.

In any case, the whole thing appears to boil down to different
interpretations of "good".

I myself learned the hard way to make certain that few avenues of
"interpretation" are left open in deals.

In one case, I advertised a 5.25" 60meg Mitsibushi hard drive and OMTI
ST506-to-SCSI card in trade for a 1meg memory card for an Apple IIgs.
After sending the drive to someone who responded, he replied upon
recieving it with "where is the rest of it"? He had "interpreted" that
the words "hard drive" implied the precense of a case and power supply.

To his credit, he paid the return shipping, so I was only out the money
to ship it out, and the waste of time. I made certain that the next
time I advertised it, that I used the words "hard drive MECH", and
verified with the person I was to ship it to that the it was the drive
and card only...nothing else.

In another case, I advertised wanting to buy a Quantum LPS105S.
Someone responded. When the drive arrived, I found it was a 105S (the
older half-height version). Before replying, I checked my mail again,
and sure enough, the fellow had only referred to it as a "105S", never a
"LPS105S", so I got what he offered. I had "interpreted" his response to
my ad for wanting a LPS105S as meaning that was exactly what he was

offering.

On another topic, I never got a response from you concerning the power supply with the 800XL you traded me having insufficient voltage output.

4362. Indus GT Drives - Power Supply

Source record: 91422

(Kennehan looked inside his 800.)
I think the '4 slot expansion' area is for the OS card and memory
modules. The rear slot has Antic and GTIA on it, this slot is not
normally accessable, the '4 slots' are accessable if you remove the
'lid'. The big capacitors to the right rear (as you face the machine.)
are part of the power supply. I really agree about the design being
very well done for its time. There was discussion about the 130xe
keyboard. If 130xe had the kind of keyboard 'ribbon' and connector the
800 has, there would be no problems in that area. I guess the 800
keyboard does break once in a while, but it is surely built better than
any xl/xe machine, IMO. The overall 'modular' design of power supply
board, mother board and separate OS, RAM and CPU boards really makes
isolating a problem much easier. The heavy metal everthing is
surrounded by was early problems, or anticipated problems, getting FCC
approval for RF interference. The 800 really is RF quiet. I've heard
HAM radio people love the 800/400 for doing things because of the total
absense of RF interference. I think the 800 was meant to sell for $800
dollars and the xl/xe machines came down in quality and a more 'mass
production' mentality took over. The early xls had completely socketed
boards. My first 800xl has a printed circuit board keyboard with real
copper/brass contacts inside the keys.

: images work correctly while the rest don't function at all.
: About two weeks ago I spent a few hours downloading the entire 8-bit
: software site only to discover that 1 out of every ten disk images
: are truly functional.

I don't know if it's the files or the emulator itself. I'm using the
2.52 version and it doesn't seem to be able to run most stuff. I'd
be able to better check if I could figure out how to convert the .xfd
files to real atari disks and try them out on the actual 8-bit hardware,
which I do have. I also need to know how to do the same for .dcm files.
I usually get the files to my 8-bit by uploading the files from my pc
to my unix account at 14,400, then switch to the 8-bit and download the
files from unix at 300 baud (xm301) - it takes awhile <g>

Any suggestions? I'm not at all familiar with programs (for 8bit or pc)
that do conversions on .dcm and .xfd files.

THE KEY TO ORGANIZING YOUR HEALTH RECORDS

"If you care about yourself and your children, you will do everything you can to know your family's medical history. It can save your life, and the lives of those who are dear to you." -- Dr. Aubry Milunsky, Director, Boston University's Center for Human Genetics (Life Magazine, March, 1995).

Your Lifetime Health Planner offers the simplest, most effective way to take charge of your health. Enter important facts about your health history, keep a record of the names of medications and their effects, document each doctor visit and diagnosis. You will have the information you need, and in the event of an emergency, so will your family.

Your Lifetime Health Planner, 198 pages in a compact, loose-leaf binder, contains a variety of sections which include "Doctor Visits," "Medications," "Family Health History," and "Doctors and Specialists." The Planner is a must for the busy executive who needs to stay organized, for seniors who are receiving care and for newborns who need a record of their health care.

Parents Magazine recommended the Planner to its readers (April, 1994) and MCI called it "a useful resource in managing your personal health records." Margie Smotherman, Coordinator, Employee Health and Wellness, Blue Shield/Blue Cross of Iowa, said: "The employees felt that these (Planners) were great tools to not only record their pertinent numbers, but to plan for doctor's visits."

To get your copy, send a check or money order for $19.95 (plus shipping and handling) to :

Your Lifetime Health Planner
1955 W Grant Rd., # 230

From: crow@coos.dartmouth.edu
Message-ID: <3puquk$21d@dartvax.dartmouth.edu>
Source record: 91491

I've written a simple C program that analyzes Atari 8-bit binary load files. It displays the regions of memory that the file will load to--quite simple.

In doing this, I found some very interesting facts after testing a number of files:
* The run address is not always the last thing in the file.
* Some files have multiple init addresses.
* Some files have garbage at the end of the last sector, typically a string of bytes all with the same value (non-zero).

So how exactly does this all work? My guess at this point is:
* When an init address is specified, the load program immediately calls the subroutine, then returns to loading the file.
* When a run address is specified, the load program waits until the entire file is loaded to run it.

Are there any other subtle things to watch for?

Eventually, I may have the program remove trailing garbage, and move the run address to the end of the file, fixing problems with broken loaders.

And yes, I'll release the source code. (Someone else can compile a PC version.)

James King (jeking7@delphi.com) wrote:
: Sold an Rtime8 to a fellow who is completely complaining because I mailed
: him an R8 that had a rubber band wrapped around it. Offered to refund
: his paltry $25.00 and he refused, but continued to fire off mail messages
: about how I "deceived" him on the condition of the Rtime8.

First I get some bogus mail in my mailbox from you saying that I've "slandered" you, which I haven't. Then I get a trio of messages in my mailbox that contains enough vile fifth-grade-quality profanity to make a harpy proud. Now I see that you're radically stretching the truth in public - not to mention outright lying.

First, let's get a few things straight right off the bat. Pay attention, as many of these things have already been explained to you in mail more than once.

FACT: I *NEVER* COMPLAINED that the RTime you sold me was held together with a rubber band. My complaint centered upon the FACT that you told me the cartridge was "in good condition", which in most people's estimation, I believe, entails a cartridge that is at least in one piece. Furthermore, you also told me that you had to solder the battery holder back onto the cartridge in order to make it work. Again, this hardly constitutes a "good condition" cartridge. If you had said to me, "hey Steve, this cartridge works, but it's a little beat up; I had to solder the battery holder back on, and it's being held together with a rubber band, but it still works" then I'd have been thoroughly satisfied (though I probably would have offered you a lower price than I did). However, you did not. Anyone - even you, I think - can see how this constitutes a deception.

Let's make an example. Let's say, for example, that I had a Dodge Daytona "in good condition" for sale, and you were in the market for one. You bought the car from me and, on the way home, discovered that the head gasket was damaged. You call me up and complain, telling me that I said the car was "in good condition". I come back with "well, the Chrysler 2.2l engine is notorious for head gasket failure and lots of these cars have that problem, so yours is no worse off than anyone else's", would that totally justify everything I told you and make you feel better about your transaction? No, of course not. (BTW, the 2.2l head gasket is a true issue, at least as prove-able as your claim to "defective" ICD carts.) The issue at hand is NOT, and has NEVER BEEN, the condition of the cartridge. The issue has ALWAYS been what you told me versus what turned out to be the truth. In our case, the two were mutually exclusive.

FACT: I never "continued to fire off" messages to you about this. My first question to you was asking what your justification was for the

APPARENT deception - a word which you conveniently missed. You replied to that message without responding to the question; your answer was, in essence, "well, everyone else's RTime is like this, so it's just the same". No reason why you told me this was a "good condition" cartridge. I again asked you for your justification; the response I got back to you was positively laden with obscenities and profanities. That's when I called you a fucking asshole and let it go at that.

Yes, you did offer me a refund. I declined for several reasons, one of which was that, considering your piss-poor attitude and your 0-for-1 record for telling me the _whole_ truth, I sincerely doubted I'd see my refund.

: I dont know about you folks, but if I were THAT dissatisfied, I'd take
: the time to mail the cart back (less than $2.00 to ship) and get my
: money back.

If I were dealing with someone whom I felt I could trust, I would as well. You've shown me nothing of the sort. At least now I can say that I have a cartridge. Hopefully it even works.

: I know for a fact that CSS mails off their MUX carts with a rubber
: band holding the two shells together, and that at least %60 of the
: carts I've purchased have come in that condition as well.

So? That has NOTHING to do with our transaction.

: Any feedback on this thread appreciated.. I'm tired of this idiot ranting
: at me in mail. Wont post who it is - but YOU know who you are! SHEESH!

If you deem someone whom you outright lied to an "idiot", then I have nothing but the greatest contempt for you. Screw you, you lying bastard. Who needs you.

Well, I had a similar experience with my 800XL. As a matter of fact, I seem to remember that identical keys went bad on mine as well.

Unfortunately, my solutions were the same as yours. None of them worked for more than 2 to 3 weeks. If you wad up aluminum foil, the foil pushes the metal contact away from the mylar. The foil also will scratch off the metalic paint.

Mu ultimate solution? Either get a new keyboard (before you irreversibly damage the interface to the motherboard) or get a new computer(easier said than done!). That's what I ended up doing!

If they are, I have a gold mine in the garage.

But I certainly wouldn't pay $10 for one magazine, especially with no
cover. $2 max, but $1 or less sounds better to me.

I can see some rare ones going for more than $2, but still not $10.

in Xformer 2.0 and 2.5, DLI's occur to early. With character modes it should occur on the last line and a store into WAITSYNC should delay it to the next character line, but the DLI kicks in on first pixel line.

If character set data is updated it will not be updated on the screen unless chbase is changed, or a PM is moved on the same line, you update some characters on the line or use the page-up, page-down commands.

Thor and Valkyrie <thorvalk@earthlight.co.nz> wrote:

T> Have a question,
T> Is there a comms program out there that I could ftp for a friend with
T> a 1200 modem and a 130 atari,with which he can connect to internet.

Does your friend want good VT100 emulation, or good file transfer
capabilities ?

Kermit-65 and BOBTERM spring to mind. Also, it depends on the modem.
TERM80 is a good choice for an SX212 modem (I think TERM80 does VT100).
There is ICE-T. There is FlickerTerm. There is OmniComm. There is the
old program VT-Squared. If you want 40-column VT100 there is Chameleon by
John Palevich. What is the interface being used, an ATARI 850, a P:R:, SIO
direct connect ? Is his InterNet provider a full UNIX site or is it
gatewayed ? The answer you seek depends on many variables.

I have just returned from an archeology expedition deep in the back of my computer hutch. I have found the following items that I don't need. Surely somebody does! All prices are flexible, make an offer if you think my price is too high. Shipping will be paid by the purchaser: $2.00 for the first item, $1.00 each additional (unless otherwise noted). Software comes with original box, disk, and documentation unless otherwise specified. All prices are US dollars. Will consider trades for Commodore books or hardware.

*** Prices reduced!! Need to get rid of this stuff!! Make offers!! ***

Commodore Games

Microleage Football (Disk--Microleague Sports) $6.00
-Football Simulator.
John Madden Football (Disk--Electronic Arts) $6.00
-Football Simulator.
War In The South Pacific (Disk--SSI) $6.00
-Three WWII Pacific Ocean battle simulations.
Elite - Gold Edition (Disk--Firebird) $6.00
-Space rogue game...trade between planets and
equip your ship for battle. 3D graphics!
Gunship (Disk--Micro Prose) $FREE
-AH-64 Apache Attack Helicoptor simulation. Have
disk, keyboard overlay, box. Manual is required
for copy protection (AS IS).
F16 Combat Pilot (Disk--Electronic Arts) $FREE
-F16 combat simulation. Have disk, box. Manual is
required for copy protection (AS IS).

Commodore Applications:

Hes-Writer 64 (Catridge--Human Engineered Software) $FREE
-Text editor/word processor. No box or dox.
($1.00 S/H)
Sideways (Disk--Timeworks) $8.00
-Prints following spreadsheets sideways:
Better Working, Calc Now, Cal-Kit, Creative Calc,
Multiplan, Practicalc, Syncalc, Trio, and any SEQ
file. Works on Commodore, Epson, Okidata and a few
other printers. Supports both 64 & 128.
News Maker (Disk--Free Spirit) $8.00
-Desktop publishing for C= 128 w/RGBI monitor. Box
is worn.

IBM Software:

Central Point Backup 6.0 (Central Point Software) $6.00
-Older version but, as far as I can tell, the only
change in the newer versions (7.x) is the user
interface. Backup to tape or floppy ($3.00 S/H).
Desqview 2.4 (Quarterdeck) $8.00 Sale Pending
-DOS multitasker. Use w/QEMM for best results.
DR DOS 6.0 (Digital Research) $6.00
-MS DOS clone. Does everything DOS 5.0 does plus
some of DOS 6.x's (drive compression, memory
management, undelete utilities, etc.). A VERY
nice alturnative to MS DOS & takes half the space.
($3.00 S/H).

Books:

Card ?+G Printer Interface Instruction Book $FREE
-Instruction book for Card ?+G parallel interface
by Cardco for Commodore 64/128 ($1.00 S/H).
C2N Cassette Unit Operating Instructions $FREE
-Instructions for Commodore "Datasette" ($1.00 S/H).
Atari BASIC (XL Edition) $5.00
-BASIC instruction manual on Atari XL series

William Kendrick <kendrick@zippy.sonoma.edu> wrote:
>We DO need an ATR -> DCM converter and a real-life XFD <-> ATR converter.

Well I offered to write an atr/dcm/xfd converter, but no one has come up with specs for the dcm format. As far as I know the xfd format is only single density, but I have seen an enhanced density format, I guess it is determined by the size of the image, where atr uses a 16-byte header to determine the size of the image and the density. ATR seems to be a better format than XFD, it can be variable up to the limitations of the Atari OS, which I believe is 16MB. I tried contacting the author of dcm2dsk, but he wouldn't/couldn't give me any information on the dcm format, and I send a message to Bob Puff but haven't recieved a response, he was offering some information to another participant in this newsgroup, but maybe he didn't want to be bothered and decided not to respond. But he did note that the dcm format was no big secret, but it isn't exactly well known, I have never found a reference to the format, nor have I ever seen the source to the program that creates the images (Disk Communicator) like I have seen the source to MyDOS. I wish I could get in touch with Bob or someone who knows something about this format.

>The XFD standard should be _dropped_ _completely_!

I see no real need for the format, except for backward compatibility, I personally would appreciate it if any disk images put onto archive sites were in dcm format, or at the second alternative the atr format.

BTW, I did talk to the author of dcm2dsk regarding a dsk2dcm converter, but he felt that this wasn't something that people wanted. I suppose it is a possibility that my message to Bob went to /dev/null, I can always try it again.

From: winston@merk.com
Message-ID: <D94u0H.Mux@merk.com>
Source record: 91429

A Polish Atarian recently requested a copy of the OASIS demonstration BBS, "OASIS JUNIOR 3", from myself. He also suggested that it be placed in the Merit Archives. This leads me to the following two questions: 1.) Isn't the OASIS demo. BBS in the archives already ? 2.) Are there any OASIS Sysops out there in netland ? The reason that I ask is that the running demo. of OASIS JUNIOR 3 that I have has doc.s that focus on how to get the BBS up and running, but don't explain other things such as what the OASIS "PAL" is typically used for. Sometimes file exceptions are triggered such as "Missing MVP.SUP" (which doesn't seem to cause any problems). Also, there are questions that come to mind, such as: Can the HELP menu be resident while the HELP text files are not ? What is the name of the 'Z' file ? et cetera. As I realize that the Merit Archives are a world resource, would one just dump a "working copy" of a program to the Archives ? I assume that an actual OASIS BBS Sysop who has used OASIS IV in the past would know what all of the various pieces of code required are for the demo and what it is that they do. I am loath to just stuff a "working copy" into the archive without having actual experience running the code suite. Should it be done anyway ? Anyone have any opinions on this one way or another ?

4388. Re: Desperately seeking SIO2PC cable!

Newsgroup: comp.sys.atari.8bit

Body handling: HTML body converted to readable text

Have you tried Nick Kennedy himself yet? I seem to be one of the few
people that regularly hack the SIO2PC cables, but under normal
circumstances i.e. I have a life/have never been paid a nickel for
one I think it's understandable, it takes me up to two months to get
around to finishing one.
I kept thinking the last 4 years or so someone would jump in and start
making the cables for a resonable price, but I keep hearing prices like
$50 which is what Nick charges (or used to charge himself) & at least
he included that at that price the shareware fees were covered also.
I've been dancing around the commercial thing on the Internet also.
I'm thinking I could make them for $25, you'd still be responsible
for the shareware fee of $10, & I could get my turn around time down
to less then 2 weeks. The construction of the ones I make is not really
robust, a $2 Radio Shack box & soldering that could best be described
as amaturish, but they do work & I've never heard of one breaking yet.
If you're interested I'd like to set it up on one of my other accounts.
I just spent a 1/2 hour looking through my mail for the address of the
guy who was going to trade me some tea for a cable & apparently I deleted
it. Something that would work for me is send E-mail with your
address to ricortes@garg.com & you pay a couple of weeks after recieving
it.
If it works out I'll throw my hat into the vendor FAQ ring so I won't
have to take up bandwidth like this again.

4389. 8-bit files from Mac -> Atari?

Make an offer. I just want to get rid of this before I move.

Star SG-10 printer - Does tractor feed or friction feed for stationary and envelopes. Uses charater sets to allow graphics printing. Originally considered "the" printer for Atari computers. Original box, packaging and manual included. *NOTE* - will also work with ST computers with a standard parallel cable.

Dust cover specifically designed for the SG-10.

Desktop printer stand - Elevates printer on desk so paper can be stacked under it.

Printer interface - Parallel printer interface which allows other devices to daisy chain off of it.

What is with the ATARI Driving Controller? This is the controller that looks just like an ATARI Paddle controller, except that there is a little top view of a race car on it. Also only one controller is used per joystick port unlike the paddle controller where two controllers join a single connector. Anyway was there ever a game that worked with this controller? It does not work with the ATARI Poll Position cartridge. I have to use a normal joy stick. Could I re-wire it to work like a joy stick. Right now when I turn the knob, the car speeds up or slows down.

The ONLY game to ever use it was 2600 Indy 500 (Sears Race). It uses a
quadrature signal (like a mouse) to give 16 phase changes per 360 degree
rotation. I still need to add a Driving Controller test to the 2600
controller tester cartridge i'm working on.

Atari 8-bit demos were unbeaten until the Amiga and ST came along
... and they still continue to wow today! Some of the demos I liked were:

1. The Small Demo
2. The Dark Shadow
3. Boink
4. Boink2
5. Colorview (not a demo, but let's you view digitized color pictures!)

and my old favorite:
6. Death Of An Apple. Not much technically, but still produces a smile!

Drive 1 Both switches to left.
Drive 2 White left.Black right.
Drive 3 Both switches to right.
Drive 4 Black left.White right.
If you are feeling adventurous you can fit a switch on the front panel
to select either drive 1 or 2.My 1050,s also have a dual coloured led
fitted to show drive number selected.
Whoops,think I might have sent this to Rob.Sorry about that Rob :-).

Mark:

THOSE DEMOS ARE >NOTHING!< They are WEAK compared to the AWESOME works of:

ABBUC
POKEY
High Tech Team
Slight
Hard Software
Shadows

Specifically:

the HobbyTronic and Halle Project demos (yearly demos, speaking
of which where is Halle Project 1995 !?!?!?), by ABBUC/POKEY and others,

The BIG Demo (mainly cracked musics from games, some small graphics demos,
two digitized songs and a HUGE (64K!) scroller!), by the no-longer
existant High Tech Team (although at least Frankenstein is still around)

The AWESOME Bitter Reality Demo by Slight!

The great "Veronika" and superb "Cool Emotions" demos by Hard Software!

The awesome "Sweet Illusions" demo by Shadows.

Finally, I forgot who made this!!! The Intel Outside demo is awesome too!

I was just looking the the Branch Always Software newsletter for May 1995
that just arrived, and it at LEAST mentioned this:

People not upgrading to Win95 can STILL use GEMULATOR (at least) under
Win 3.1[1] by using Win32s, which he distributes freely.

Also, OS/2 Warp comes with it (Win32s) built-in.

Perhaps PCXf4.0 can use it too???

JAMES! (AND EVERYONE ELSE!)

There arw TWO versions of DCM2DSK.. The original, and v.2. (DCM2DSK2.ZIP).

v.2. has a "thanks for bug info to bill kendrick" :) :) :)
and it works fine on non-screwed-up DCMs (it sometimes dies on messed up
ones I guess) (also, neither version supports multiple-file DCMs that
I know of :( )

v.1. died a lot... I told the author (Jason Duerstock) and I guess
he fixed (most?) of what was wrong...

I STILL want to see ATR2DCM (and DCM2DSK STILL should be called DCM2ATR!;
he chose against it because of the (rarely every mentioned!) ATR hardware
thingies I know nearly zilch about :))

Source record: 91444

As if Mr. King didn't have enough problems. Here I come to be really
petty and ask what may turn out to be a stupid question.

Is it just me or is 90% of Mr. King's XMission site completely
useless? My strict definition of useless is only a few of the disk
images work correctly while the rest don't function at all.
About two weeks ago I spent a few hours downloading the entire 8-bit
software site only to discover that 1 out of every ten disk images
are truly functional.

Now this in no way is a post to flame Mr. King or to accuse him of
violating my right to have working disk images. I have no such
rights. I simply want to know if I've got my thumb up my ass and
am unable to properly execute the images.

Please allow me to elaborate on the procedure I must go thru.

1)UnGnuZip the file I want. (It's a long story about the UnGnuZip part.)
2)If it is dcm, use dcmtodsk v3.2 to turn it into a .atr or .xfd.
3)I still haven't figured out the right way to deal with those damned
.exe's and .com's
4)Run xformer v3.0a and watch the pretty emulated Atari blue screen.

Several other people have posted to this newsgroup with the same
problems. SO WOULD SOMEONE AT LEAST HAVE THE DECENCY TO HELP US
OUT INSTEAD OF LETTING US FLOUNDER? PLEASE?

Some of the programs Mr. King has on this site can not be found
elsewhere, so I would greatly appreciate any help anyone could
give me. (I've scoured the FAQ's, but to no avail.)

(1) Since when is there a dcm2dsk 3.2? The lasted I knew of was v.2, and it only does dcm -> atr.

(2) Are you downloading in binary mode? Also, when you FTP from James' ftp directories, you don't need to get them as .gzipped files, if you noticed the readmes all over the place!

(3) I've downloaded a HELL of a lot of stuff from James (most of which I've junked.. I'm not *that* much into Pinball (CSet) games and weeny small hard to play adventure games :)). Almost EVERYthing I've tried works fine...

.dcm IS the standard disk image format on the Atari.. to make real physical disks out of them you of course need an Atari and a drive, and then get a copy of "DiskCommunicator 3.2".

To convert .ATRs to .XFDs, be sure they're the right size (I think XFD can only be 90K? (standard 810 Single Density, Single Sided)) then remove the 16byte header.

To convert .XFDs to .ATRs, find an .ATR of the same size and density and paste its 16byte header onto the front of the .XFD data.

Finally, to get DCMs to ATRs (the only other thing I know you can do), just run DCM2DSK on the DCM.

We DO need an ATR -> DCM converter and a real-life XFD <-> ATR converter.

The XFD standard should be _dropped_ _completely_!

Here's what my problem was, I was posting to c.s.a.8 and it said
"Article throttled
No space"

and asked if I'd like to Spell-Check, Edit, Send, Abort again.

I edited it, went to the "Cc:" (Carbon Copy) line and added
"comp-sys-atari-8bit@cs.utexas.edu" to it..

Then I went to send it, thinking it'd e-mail it and get an error posting
again.

It didn't, it e-mailed it and it POSTED it successfully. :) Hence, two
posts for the price of one. (One via the cs.utexas.edu e-mail-to-news
server and one via the news server I'm on.)

>they need those for? They also used a TON of aluminum in it also. I think
>this system was very well designed for its time period.
>

Nothing really secret but maybe some interesting history!

1: The edge connector fingers on the rear of the motherboard were for test purposes but never used. The original 800/400 was tested and burned in while connected to a mainframe (Data General Eclipse) via the 4 joystick ports and SIO with a special Diag Cart.

2: The very strict FCC class B standards of 1978 accounted for the large Aluminum casting (and tons of filter caps) with the RF modulator built in. The standards were relaxed in 1980 hence the C64 and later XL series.....much cheaper to produce.

3: The large filter caps on the power supply board are pretty standard fare for a clean DC supply from an AC input via a bridge rectifier.

4: As for the cards, the OS was designed and expected to be upgradeable (It was written in only 4 weeks!). The RAM needless to say was expandable due to its very high costs in 1978. The CPU card was never intended to be changed, it was put on a card so it could be mounted vertical and save space in the footprint. The CPU was placed under the RF casting and unaccesable for that very reason.

If only the first year of production would have had Gold vs Tin-Lead fingers on the cards! The original 800/400 was a very robust and reliable design design not counting the Tin-Lead fingers. Too bad the

same could not be said for the first 810's....

>would I need to hook it up?
>
Robert Rumpf's answer is correct, an 850 interface is the "official" Atari hardware for connecting to a modem. However, there are numerous other options (though they are likely more difficult to find). The general answer is yes, you need some kind of RS-232 interface. The 850 daisy chains to the serial port. There was one, I believe which went into the cartidge port. There was another which used the joystick ports. Most common, though, was an interface much simpler than the 850 (which has 4 RS-232/modem ports and a Centronics parallel printer port) called the R-Verter. It plugs into the serial port and has one RS-232 port. Plans for building a copy of one (an original one would be quite hard to find) are available in the UMICH archive site, under the name BOBVerter, I believe. The parts (aside from a sacraficed serial port cable) would likely cost less than $15.

Of course, I hope you realize this is just the first part of using a modem--you will also need terminal software. This would consist of a R:-device handler appropriate to the interface you end up with, and a term program capable of using that handler. Everything you need should be available from the archive site, or from the suppliers mentioned in the Vendors list.

Yeah, I know nothing about the Amstrad, but the Atari's sound and graphics capabilities (esp. the graphics, esp. compared to the C=64) are fabulously shown off in some demos, esp. some of the newer ones.

They of course mainly (like 99.99%) come from Europe (specifically Poland and Germany mainly) so if you know German or Polish, it'll help for reading the scrollers, but I mean, who cares about the scrollers when you've got an AWESOME plasma graphic and great music going on!? :)

Binary? What's binary? (For the joking impaired,
this IS a joke.)

> Also, when you FTP from James'
> ftp directories, you don't need to get them as .gzipped files, if you
> noticed the readmes all over the place!

Uhhhh... I get the feeling you didn't read my post closely. I had
indicated the Gzip problem was a long story because I didn't want to
say what I'm about to say.

My crappy FTP program would not let me type in the name of the file to
download w/o the .gz extension. I don't know why it wouldn't let me
do this. It kept on returning File not Found errors. Ultimately, I
switched to another FTP program that will let me leave out the .gz
extension, but I am not about to spend another 3 hours downloading 5+
MB of Atari files.

I was simply including the Gzip procedure to help in troubleshooting.

> (3) I've downloaded a HELL of a lot of stuff from James (most of which I've
> junked.. I'm not *that* much into Pinball (CSet) games and weeny
> small hard to play adventure games :)). Almost EVERYthing I've tried

You might be refering to a system like my Corvus HD with a mirror card in
it that allows backup via VCR. The Corvus is only 7meg (my model anyway)
and it simulatesup to 8 drives each holding one of 46 single density or 23
double density virtual disks that you can swap in or out as you choose. It
runs via joyports 3&4 (800's and 400's only) but is suprisingly fast.

From: cmwagner@news.gate.net
Message-ID: <3q3rkf$q67@navajo.gate.net>
Source record: 91364

I am wondering if there is any way to raise the buffer size on Bobterm. 12K just doesn't cut it. Is there some sort of RAM upgrade that it works with?

Disk writes every 12K slows down the transfer quite a bit and I think it would be more efficent if the buffer is larger.

|> making the cables for a resonable price, but I keep hearing prices like
|> $50 which is what Nick charges (or used to charge himself) & at least
|> he included that at that price the shareware fees were covered also.

[snip]

I have been investigating the posibility of having the sio2pc board
professionally etched (wiring the board is the pain) and then selling
both kits (all the pieces and the board you solder it together) and
complete cables.

However, to make this at all profitable (or at least to keep it from costing me
too much) I would need to be able to guarantee at least 50 sales to justify
having the board etched. My estimate is that a kit would cost $12-$15 and an
assembled version would be enough more to justify my time. (or I will sell
the kit to other people to build)

I really don't want to make any money on this I am more interested in getting
as many people using the SIO2PC as possible to insure its continued support.

Send me email if you would be interested in this.

Sloopy; it is a little more complicated then that. For one thing the data
is inverted from RS232. The way RS232 works is it always expects a 'START'
bit. RS232 then uses this change in logic state to center the sampling
of the data i.e. @ 1200 baud you get a bit every .05 seconds. When RS232
sees the start bit, it immediately waits .075 seconds the samples the data
line or sets the transmission line as the case may be. The data lines are
then sampled every .05 seconds so the sampling takes place exactly in the
middle of the data bit timing. And don't forget the data would be inverted,
you'd have to EOR #$FF all the data to convert it to it's real state. If
you didn't do the inversion you'd probably get what RS232 would consider
a steam of $FF's when nothing is being sent. OK, maybe all this could be
taken care of with some wild programming, but this is one of the reasons
I consider myself a hardware guy vs a software guy. I could do the same
thing with a chip in an hour, but I'd bet the programming to overcome
the other problems would take hours to beat.

Well I should have changed the title of the message, but anyway. Chad,
You left out the 'D' in "Atari OS" since it is a DOS limitation. I'm
almost to the point of saying maybe another format is due, but a well
documented one vs Discomm which nobody seems to know much about or
isn't talking. I've heard this is the same reason why xmodem became
the tranfer method of choice. It was one of the least suited for the job,
but everybody else got greedy & petty. Saw visions of getting a royalty
off of every file transferred so they charged up the kazoo & keep their
transfer protocols secret or patented or copyrighted. I guess Discomm is
shareware so the authors are protecting their interest. I've got a copy,
but I've only used it once so never registered it. We really don't need
a huge amount of compression. I'd be in favor of a non shareware disk
transfer program no matter how bad as long as it was documented. Something
simple that everybody knows, like the Micro Illustrator picture compression
format would be fine with me. Ditto for header bytes, just something simple
like .byte density .word total sectors would be all that's
necessary in the header.
Rick

4430. Atari 810 & 'THE CHIP'

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-26 00:00:00 UTC
From: classics@en.com
Message-ID: <3q58n6$rp2@antares.en.com>
Source record: 91373

I recently obtained an 810 drive with an interesting modification
to its side board. Its has 3-4 jumpers installed in the rear
of the board, and an EPROM labeled 'THE CHIP' where one of the
normal 810 rom's would be.

Funny thing is I cant get the drive to do anything special! :(I wont
accept a command to go to double density and the copy of the
Archiver software I have here wont run on it.

Anyone have any idea what this modification was for and where
I can get some software that supports it?

Steve

4431. TECH: SIO Status reqponse

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-26 00:00:00 UTC
From: classics@en.com
Message-ID: <3q595k$rp2@antares.en.com>
Source record: 91374

Can someone give me some information on the response the disk drive
provides to the SIO STATUS command?

When the computer is turned on, the first command sent over the
SIO bus is a status frame for drive 1 that looks like this:

$31 (Drive #1)
$53 (Status)
$00 (Aux 1)
$00 (Aux 2)
$xx (Checksum)

I need to know how to formulate a proper reply to this, from what I have
seen from observing Nick's Sio2pc a status reply from a single density
drive looks like this:

$41 Ack
$43 Complete
$??
$??
$??
$??
$xx (Checksum) (I can calculate this)

What I *REALLY* need to know is what the bytes $??
signify! :(The $10 and $20 seem to change bitwise depending on
the format, but I have yet to figure it out.

Thanks in advance for your help!

Steve
--
Ps. In case anyone is interested opon bootup if the atari gets a
bad/no status packet in return to its inquiry it goes to the
Self Test/Memo Pad screen. If it gets a good status packet it
goes into the boot routine and starts requesting sector 1 of drive 1.

Actually it is public domain, I am using it right now on the Atari. :)

>a huge amount of compression. I'd be in favor of a non shareware disk

Well let's face it, Disk Communicator doesn't do a huge amount of compression,
it uses RLE for compression, which sometimes is good and sometimes as bad.

It compresses those empty sectors real well, heh.

>like .byte density .word total sectors would be all that's
>necessary in the header.

I am not a good programmer when it comes to the Atari, I never invested alot
of time in learning how to program on the Atari, most of it was spent on the
Commodore. The Atari was a little tough to understand for me, it was how it
accessed the serial bus, weird.

Message-ID: <3q5926$1p3m@hopi.gate.net>
Source record: 91378

I would like to know about what known bugs there is with the XF551? I heard of a density switching problem. I seem to have encountered this. It is apparent when I booted a single density disk then I reboot and try to boot a double density Sparta disk, I get Error: No DOS, then I have to reboot again and it boots. How is this problem resolved? I heard of a fix. But I don't want to do the CSS fix where you have to upgrade the drive as well. Doesn't the CSS fix fix this problem and upgrade it to a 3.5" drive, but can it write 720K or is it still 360K?

My BEST guess as to DCM's format is simply it removes all empty sectors..
But, what do I know? It could be more compressed than that.

I feel that for the folks who just have disk drives that an entire disk-sized
image such as an .ATR is a real problem.. I know my 1027 free sectors
couldn't hold a 1040-sector-long file!!!

Anyway, I think BOTH formats (.ATR and .XFD) should be dropped from the
online services (hear this James King? :)) since:

(1) If you have a DCM and DCM2DSK, there's no point in wasting space
and compatibility with nonPCXf and nonSIO2PC users (ie, the OTHER
1000s of Atari users) by keeping ATRs around instead of DCMs.

(2) DCMs take less space and everyone can use them

But, unfortunately, there is no DSK2DCM (ATR -> DCM) converter.. actually,
this could be a #3 up there, but if you have no PC to use SIO2PC on you
won't have any DSK2DCM to use unless it were written for the Atari..
again, pretty useless since .ATR disk images are larger than the amount
of free space on a disk of the same size. (Of course, some people DO have
PCs but DON'T have SIO2PC, and well, they're either broke or lazy! :) or
have a hard drive on their 8bit :))

Anyway, my point is:

(1) YES, we need a DSK2DCM.. Jason, you hearing this?
(2) NO, ATRs and XFDs are NOT useful to the Atari users who don't have
PC Xformer and/or SIO2PC.. they should be dropped as standards on
FTP sites and BBSes.. James, you hearing this?
(3) NO, people using PC Xformer or SIO2PC DON'T have the right to
complain because ATR and XFD formats aren't everywhere BECAUSE
they HAVE a conversion program! People using DCM ONLY >DON'T<
have an ATR/XFD to DCM converter and even if they DID most of them
couldn't use it since disk images take too much space!

Whew!

Sorry for the ranting and raving, but do you people see my point now?
(Esp. you pseudo Atarians running only on Xformer)

Ahh!! WHAT!? The deviced-based I/O on the Atari is AWESOME! From what I recall of the C=64 (seeing how you did directory listings! (yeah, just delete your BASIC program to do it in BASIC!) and how you did loads! BLEAH!) it is MUCH better!!

You should really sit down in BASIC or Action! or TurboBASIC XL and play with some file I/O.. (I recommend TBXL for beginners, Action! if you've got the libraries for it, and, well, BASIC sucks :))

4439. BobTerm buffer.. bigger buffer is bad!

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-26 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3q5gcu$m4i@nic-nac.CSU.net>
Source record: 91382

Unless you have a fast destination drive (in which case copying to it from RAMdisk; ie, downloading to RAMdisk), having a larger buffer is pretty dangerous.. even with a 12K buffer I'd often get timeouts when downloading just because writing 12K to my 1050 would take FOREVER.

Inotherwords, the longer it takes to save the file the better chance you have of getting timeouts.

The one thing I HATE about BobTerm is:

(1) All of the protocols it supports DONT have "resume" (or "restore")!
(2) THIS I HATE: If a download gets aborted, it DELETES the FILE!
Under most DOSes, this takes just as long as writing the file out!
Argh!

(C. Wagner dislikes copy from RAMdisk to disk.)
I don't know why? It should be simple and straigtforward to copy from
RAMdisk to disk. I do it all the time.
Other uses for RAMdisk? Well, Diskcommunicator can use extra RAM.
Tom Hunt's 'Snapshot' allows keeping two or more boot disks or DOSes in
RAM at the same time. The unzipper I've worked on. It has a 32k
lookup table for 13bit unshrink and uses bank switching. There is some
software now and probably more in the future that will require extra
RAM. I would say that RAMdisks are the most commonly used thing with
extra RAM. An extended RAM machine should solve your download
problems. Like B. Kendrick said, you really don't want to have your
buffer dumping to a real floppy during a download.

>
> What I *REALLY* need to know is what the bytes $??
> signify! :(The $10 and $20 seem to change bitwise depending on
> the format, but I have yet to figure it out.

The first byte is command status, mapped as follows:

Bit Function
0 1 = Invalid command received
1 1 = Invalid data frame
2 1 = PUT command failed
3 1 = Diskette write protected
4 1 = Drive is active
5 Reserved
6 Reserved
7 Reserved

Bit 5 is used to indicate 256 byte sectors on some drives. AFAIK, only
MYDOS actually makes use of this.

The second byte contains the value in the status register of the 1771 FDC.

The third byte is the recommended timeout for the handler (in seconds)

The fourth byte is reserved, and normally set to 0.

If you want the bit definitions for the FDC status register, I can probably find them somewhere.

Hope this helps

Pete

If there's a Radio Shack in your area, they *might* have an Atari compatible joystick (they recently discontinued it, but the RS in my area had one at a reduced price). Also, the Sega controllers (for the Master System and the Genesis) will work with an Atari.

: >Or did you just mean GIF -> Koala..

: I just meant file conversion, not viewing.

Easy! : JView = GIF -> 15
Koala Micro Illustrator = 15 -> koala.

The first step should be obvious. The second one is by booting Koala,
and typing the clear-screen button while viewing the current picture
(NOT the menu!!!!). A Gr.15 file called D:PICTURE (I *think*!!!!) or
PICTURE.DAT will be automatically vanilla-loaded into memory. Set the
correct color pallette, and save as usual. That's it!

Recently I downloaded John Dunning's CC65 from the Merit Archives. I discovered that this version of CC65 appears to only run under variants of SpartaDOS. When rummaging through a box of disks for the MAC/65 source code to MyDOS 4.50, however, I ran across an earlier version of CC65. This version of CC65 appears to be able to run under MyDOS. There is also a very mysterious program contained in the file archive called: UNBUG65.COM

Does anyone have any idea what "UNBUG65.COM" is used for ?

How does this early release of CC65 differ with the release currently on the Merit Archives (besides being able to run under normal DOS...) ?

Thanks

P.S. Why is all of the stuff in the CC65 programs on the Merit Archives -- such as the DUMAS uudecoder -- organized so that it runs under the SpartaDOS-X cartridge ? You would have to edit the batch files for use with normal SpartaDOS.

(1) You load the Atari .exe's under a DOS on the Atari.. example:
Under AtariDOS or MyDOS: [L] for load "file.exe"
They aren't PC executables!
(2) What version of DCM2DSK do you have? You need v.0.2 beta (the current latest). My name is mentioned in it too :) .. Also, did you "receive" all of your files in binary mode?
Also, if you used Gopher to get the files, some servers or gophers or something don't think .DCM files are binary ("Bin" or "PC Bin").. careful!

And yes, Ataris have compressed files: .ARCs. You'll need an unARCer and if you're using a PC you'll probably want the unARCer on the Atari. :) (Otherwise it'll unARC onto your PC's drive, then you'll have to get them all into an Atari disk image and then delete them off of your PC! :))

2nd Post here, Dont know if you guys replied or not as my mail screwed up.

1. Has anyone got any info on get the compacted files from the Amiga (PC people back off, Amiga designed by the ATari 8bit god JM) to the 8bit.

2. Failing the above Has anyone got the wiring diagrams for the 850 to a standard 232 lead. Does it exist even???

3. What programs will I need at the 8 bit end to decompact the files...

4. What sites etc are there about for the 8 bit. Seen Xmission but Im trying to find Jumpman by epyx (THE Best game next to star raiders & Spelunker). My poor old J/man disk has died... sniff sniff

Hope you guys can help a poor old guy who was around when it all started.. Atari lives on via us..

Paul Irvine.
Ex Atari user mag, semi OK programmer & lover of the 8 Bit.

Sandpaper also works well for worn out nintendo controllers when the contacts get dirty and the controller doesn't respond well. Works well for Atari joysticks too when dirty contacts are the problem. Unfortunately, the biggest problem I have with joysticks are broken rings, for which I have not found a satisfactory fix (superglue doesn't cut it). :(

> -=> Wfr.!! Per-Erik "Pekka" Peterson.!! <=-

I think a little bit of this should be tolerated since it's really all a discussion of emulation options. We shouldn't have to 'drop' a topic just because it drifts to a finer point. What if two people are discussing which is the better printer for use with the 8-bit, and a post comes out that doesn't mention the 8-bit, but rather compares the 2 printers. Should the thread stop?

If this thread had gone on for weeks constantly comparing OS/2 and Win 95, then obviously people have gotten off track, but there have only been a few such posts, and in a thread about Emulation under Win 95, so it seems relevant to me. We certainly are going to be seeing more posts from Win 95 users and hearing their experiences when PCXF4 ships.

Just my $.02.

Yep, you definitely have to go back and get the files again.. if none of the executables work and none of 20+ .DCMs work with the latest version of DCM2DSK, your files are definitely messed up.

If you're doing FTP, do it like this:

```
ftp ftp.xmission.com
[ asks for username or you type "login" or "user" ]
anonymous
[ asks for e-mail address ]
[ type your e-mail address ]
cd users/j/jeking/8bit
bin <--- the IMPORTANT command.. should say "mode set to type I"
or some such thing
```

now your files should be ok, as long as you're downloading them properly :)

good luck! if you have any more problems, feel free to ask (me in mail or everyone as a post)

'tis what we're here for! (that and to rip on James King! bahaha! just kidding! hehehe)

Hmm.. I use ncftp, which automatically assumes binary mode - I never had any problems relating to binary vs. text transfers. I am going to try to d/l them again...

And since we are on the subject of running stuff... From what I remember most of the games did not run from dos on the 8bit Atari. I used to use differnt boot "loaders" - I think the one I used the most was called Bootstrap - (t'was over 7 years ago, so I might be wrong) - any thoughts on that?

Cheers,

From: esmith@netaxs.com
Message-ID: <3q8gb3$a2d@netaxs.com>
Source record: 91320

Just some general questions about the Atari. I have been away from the 8 bit for awhile and wanted to know a few things on it. First off is there any comm or terminal program better than 2400 baud that will work on the Atari. I heard of a 9600 modem as I was putting mine away. Have they done any better on this. Using a ATR-8000 as a interface does this help any? Also, is there any hard drive setup for the 8-bit that does a good job. And what is the max you can do with it. I know of the MIO setup, but wanted to find out more on any new item that has come out for the Atari. I did hear of a drive system with a tape back up, but am not familiar with it. Any help to these questions would be helpfull. Please leave any replies or suggestions to these items and where I might be able to find them. Thanks.

4483. P:R: Connection wanted

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-28 00:00:00 UTC
From: jfsorg <jfsorg@grape.epix.net>
Message-ID: <Pine.SUN.3.91.950528125907.16169A-100000@grape.epix.net>
Source record: 91326

Maybe I'm just lazy, but I just got a used 2400 baud external modem and I'm now looking for an ICD P:R:Connection interface for my presently unused Atari 130XE. Several years ago I compared all of the available options and determined the 850 to be unsatisfactory and the Black Box from CSS more than required. Perhaps someone has more information on the MPP line of interfaces or others.
I wrote ICD in 1990 and they sent me a brochure and recommended a few retailers. I would prefer a new PRC, but perhaps a good used one would be worthwhile.

Thanks,
John

An update, if anyone is still reading:

I yanked the US Robotics off and attached a Hayes Optima 9600 baud modem. I plugged it into serial port 1 on the 850, and booted up 850 Express. Now, I can send commands to the modem, dial out, etc. - but I can't get any data back IN from the modem. Is this a cable problem? I've got a standard 9-pin to 25-pin PC serial cable between the 850 and the modem, and am also using a standard 9-pin male to female gender bender at the 850 end. Should this work? I've tried the other serial ports on the 850, but only the first one works from 850 Express.

As far as a handler for Ice-T, I'm still stumped. I managed to get past this - a little. I booted up the Ice-T disk, and loaded the AUTORUN.SYS from the 850 Express disk. I then bailed out of 850 Express (by hitting RESET) and got back to MyDOS. From there I loaded ICET.OBJ (version 1.0) and was able to get in without the "No R: Handler found" message. The problem is that at that point I can neither send or receive from the modem.

Help! The only comm stuff I've done with the 8-bit up until now has been to use the 850 Express that came with my SX212. I'd like to move up to a faster modem thru my 850 interface, but keep hitting the wall. Any advice would be GREATLY appreciated!

Thanks,
Scott

4485. Atari 8-bit FTP site?

Body handling: HTML body converted to readable text

Specifically about the ATR8000. As much as I like mine, it doesn't use a UART or ACIA chip to handle the serial comunication. It's all done with bit banging and timing loops. I think I may have had mine go as fast as 4800 baud in a null modem set-up, but that's about it. The other devices for RS232 seem to run [850, PR:Connection, MIO, Black Box] as far as reliability of higher speeds go. Something like 3 versions of the PR with some users claiming higher speeds. MIO & Black box should give identical performance at up to 19,200 baud since they both use identical serial chips, but the Black Box built in software seems to handle higher speeds much better. There's been a lot of rumors of someone who has written a loadable handler for the MIO, but I'm not sure if it is accurate or if the file is in wide distribution.

It's very possible, but everybody seems to be busy with other projects.
It's not straight RS232, but ttl levels so, the approach one person is
taking is using a MAX232 chip to convert the voltage levels. The other
approach the author of the translator has taken in the past is to hook
the Atari devices up to the printer port so the voltages are right &
just do it all with bit banging & timing loops. Just my opinion, but
I think most people are just waiting for what comes out of PCxformer
since that's probably the only thing he'll support with his software.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <139522@cup.portal.com>
Source record: 91332

Kevin, I've been fooling around with SIO2PC for the last 4 or 5 years &
I've always had problems with SD/SIO2PC combo. The work around I use
is do all the disk creation & formating under MyDOS, then boot Sparta &
use it from there. SD can handle 16 meg MyDOS disk, but I believe it has
some serious problems with directories on earlier versions of MyDOS.
I'm not sure if this has changed in the most recent versions of MyDOS,
but maybe someone else has tried it.

Howdy !

Is it possible to link my old 286 with my brand new 130XE ? I will use the
286 as a data storage for my 130XE . Exists there programms to do that ?
Or is it simple better to connect a harddisk with my Atari...(It is very
expensive !)...

> Hi guys n gals
Howdy !

> Having used and enjoyed c64s for several years I wish to purchase another 8
> bit computer. At the moment it is a toss up between atari 800 and
> amstrad cpc.
the atari 800 has several special chips and this make the atari so
exciting ! If you can programm the atari 'profi-like' is the result
brilliant . But that's just why it is very difficult to code programms and
demos in good quality .

> Is there a demo scene on atari 800?
Yeah ! See other messages...

> I would like to learn to code whichever
> machine I buy, and start producing demos... I know the Amstrad scene is still
> kicking but what about Atari? Any sceners out there? Let me know
However , the Atari - demo scene is still active . The scene is today
perhaps more active than 2 years befor (i think) ...

Here in germany is the 'HALLE PROJEKT' and the DEMOS of 'Atari Bit Byte
User Group' the popularest. But there are a lot of good 'noname' coders
who produces very good onepart demos . Do anyone out there heard of VISDOM-
Demo , RAP-CAT or 'DAS OMEN' ? Those demos have very interessting
routines !

But i dunno the scene in usa or australia . What's going on there ?

Sorry for my bad english , I'm a learning pupil :))

SIO2PC is exactly what you want.. Use the PC's drive(s) as storage for
Atari disk images (up to 16MB per image!); up to 4 drives (each numbered
anywhere from 1 to 8) can be virtually "connected" at a time, plus a "printer"
(either send printer output to your PC's printer, screen, or a file!)

Also, access to your PC's files is relatively trivial, as is getting a file
from your Atari to your PC. (Also, there are some utils for getting files
out of SIO2PC disk images w/o even running SIO2PC or booting up your Atari)

The plans are more or less free (available via FTP), as is the software.
The parts are relatively cheap. The Shareware fee is $10. Nick Kennedy
(the author; check the c.s.a.8 FAQ pt.2: Vendors/Developers) charges $50
(which includes the SW fee) for a complete cable and $25 for a non-assembled.
Others charge $50 (an esp. outrageous amount seeing as Nick only really
sells them for $40 if you don't count the SW fee!) for complete cables.

ftp to: atari.archive.umich.edu
cd to: atari/8bit/Sio2pc
get: -- uhh... most of the files there? :) Actually, it may well be
time for someone to clean up the old versions which are out of
date.. dunno if the "latest" version has the plans tho!? :(--

Can't get to Umich?
Can't get some files you need?

Well, be sure you've:

(1) Tried FTPing to: "amiga.archive.umich.edu" which is identical to
"atari.archive..." except:
a) CD works strange (can't "cd abc/def", just "cd abc" then "cd def")
(can't "cd .." because it acts like "cd /")
b) It's almost ALWAYS open (no "too many anon. users!")
(2) Tried Gophering to "gopher.archive.umich.edu" and going to "Merit Archs"
which is the same as FTPing except:
a) Menu driven; easier to use
b) Be careful about if it knows binary files are really binary
(should say "bin" or "PC bin" next to them; sometimes when I
Gopher it doesn't recognize .DCM files as binaries! oops!)
(3) Tried BART .. forget how but it's an auto-e-mailer for UMich.
Check the good ol' FAQ!

Scott Butler <sydtech@skypoint.com> writes:

>I recently picked up an Atari 850 interface module at a garage sale, and
>am attempting to use it to hook up a US Robotics modem to my 800. I'm not
>having a lot of luck thus far, and the documentation for the 850 is
>really no help. Can anyone give me some advice or point me to some
>relevant FAQ on this subject?

I am certain some other user can provide the reason, and possibly
other ways around it, but I do know that the 850 can't use a standard modem
cable, even with an adaptor (at least, I wasn't able to get it to work).

I use the Atari modem cable. It is wired correctly, and I've been
able to use any modem with it (USRobotics, Practical Peripherals, Hayes,
and Intel, anyway).

B&C Compuervisions of Santa Clara, CA has them:

CAA003 850 to Modem Cable $15.00

give 'em a call at 408-986-9960

Their hours are 10 AM to 6 PM, Tuesday through Friday, Pacific
time.

Yep, it's in the FAQ. The plans for the SIO2PC cable are contained in
the SIO2PC.ZIP file(s). You should download at least version 3.17 &
build the single chip version. The files are available at archive.umich.edu
and several other sites. If you want a slightly simpler design, ask me.
The cost should be less then $10 for the original version, about $6 for
my version. Someone is considering making a run of boards for sale as
kits or assembled & tested, but he needs about 50 orders to cover his costs.
In order of preference, I'd like to see the board run be made, you build
your own from supplied plans, I build you one for money<g>. I'm going
to hold off on the building you one just to see if the board run can happen.
If it doesn't, get back to me in a couple of weeks & I'll do it.
Rick

Hi:

I have two years of ANTIC magazine for sale:
Jan. - Dec. 1984 (except May)
Jan. - Dec. 1986
plus 5 issues of APX (Atari Program Exchange) monthly

Whole package for sale at $28 (that's a buck a pop!)
Price includes postage to your door. Or -- even cheaper if you're in the
Philadelphia area and want to meet for drop-off.

Email DavidN9000@AOL.COM if interested!

4512. 8 bit parts offer

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-29 00:00:00 UTC
From: jjessop@ix.netcom.com
Message-ID: <3qdhtq$lfi@ixnews2.ix.netcom.com>
Source record: 91269

Well Atarians, Its now time after all these years to get rid of most of the stuff in the garage. Here is the offer.......PLEASE READ IT!

The components I have are mostly that, components, boards, plastic, I/O cables.....lot's of parted out Atari 8 bit stuff. Very little of the XE variety or latter than vintage 1985 Atari. I want them to go to people that honestly need an item, not to people that will resell anything.

Via private E-mail let me know what you may need and I will respond if available. Please tell me why you need it also.......because I want to have 25 extra I/O cables is not what I want to hear! For most items the cost is *FREE* (a great price for just about anything) you pay the shipping if it's a large item. Another reason for telling me what you want and why is to not send you the wrong thing. If your "motherboard" is dead.....I do not want to send you one missing items and untested. Because I used to repair Atari's to the component level only, most of the boards I have are missing components. I am also not prepared to repair any Atari stuff right now. If you are in the San Francisco Bay Area you can pick the items up if you wish.

Sorry I can't list out everything, but if its a part from a pre 1985 Atari 8 bit the chances are good I have it. Of course for *FREE*, I do not warranty anything.

Jerry

4513. Current Notes Continues

Newsgroup: comp.sys.atari.8bit

Message-ID: <2FCA8E25@POST0.LAAFB.AF.MIL>
Source record: 91270

Many of you have received the May/June issue of Current Notes. In his editorial, Joe Waters announced that Howard Carson (in Canada) as the leader of the group that is taking over ownership of the magazine. Many of you are familiar Howard through the Toronto Atari Federation (TAF) ACE '95 event as well as his column in Current Notes. Howard also recently purchased an 8-bit machine has been active on the FidoNet 8-bit echo on that front.

I am still collecting articles for Current Notes and will turn them over to the new crew when they get settled. I do plan to step down as the 8-bit editor after I assist in the transition.

The May/June issue is packed with 8-bit stuff. (There are a number of other fine pieces by Dave Troy and Dave Small as well.) Here's the run down:

8-bit Tidbits - Rick Reaser (my column)
Tips for Using Fast Fingers - Tom Andrews
IceT - Kent Johnson
FlickerTerm - David Paterson
QWK8: Offline Messaging for the 8-bit - Robert Stout
Constraints Improve Art - Joe Walsh
The Swift Report: Another Look - Joseph Hicswa
The Search for a Graphics Processor - Tom Andrews

I didn't mention Tom's second article in my column, since I got it after I'd turned in my column. There are probably several confusing things in the magazine, since things were all written at different times (like Troy's, Carson's and my pieces). Joe's editorial was written last so it is the most accurate.

: and am also using a standard 9-pin male to female gender bender at the

The standard 9-pin to 25-pin PC serial cable will NOT work.
The Atari 9-pin pinouts are different.

You will need to get an Atari 8-bit modem cable or use a converter box
and perform the following:

DB9 DB25

1 20
2 8
3 2 (stays the same)
4 3
5 7 (stays the same)
6 6 (stays the same)
7 4 (stays the same)
8 5 (stays the same)
9 22 (stays the same)

: to use the 850 Express that came with my SX212. I'd like to move up to a
: faster modem thru my 850 interface, but keep hitting the wall. Any advice
: would be GREATLY appreciated!

Also make sure you configure your modem for software flow control.

Use any one of a number of R: Handlers available which are compatible with
the 850 first then load up Ice-T. Or you can copy append Ice-T to an 850
handler, rename to AUTORUN.SYS and then run as an AUTORUN.SYS file or as
just a binary file with the name of your choice. Make sure you have the
850 turned on before you boot the computer.

Hope this helps.

: help...

I suggest you try writing a mac version of sio2pc. I wrote my own sio2pc software and it took all of 1 day. Not a real complex task, its the hardware that does most of the important stuff.

If you can use 19.2k bps serial data with access to at least 2 logic lines a mac version should be easy. If you want any help with the writing of the software let me know.

Northeast Regional SwapFest

On June 17, 1995, a regional SwapFest will be held to promote the
NEAR*US movement (Northeast Atari Regional User Support, a proposed
umbrella organization of Atari usergroups).

The location has been set for Bethpage, New York (on Long Island).
The meeting hall of a public library in the area has been secured to assure
adequate facilities. Details on time & directions to the area will be
given in future postings.

This SwapFest is open to Atarians of all persuasions: 8-bit, ST, & game
machines. Although the main activity will center around folks who want to
look for bargains (or sell/trade your "junque" for someone else's "treasure"),
some special events are also being prepared.

For ST Atarians, a featured guest speaker has been invited. Details to
follow later.

For 8-bitters, I'm hoping to demo Nir Dary's NTSC/PAL upgrade. I spoke
to Nir earlier this week & he promised to send me either one of his upgrade
kits or an already-modified 130XE in time for the Fest. This upgrade holds
the promise of opening up the entire North American 8-bit market to European
software producers who currently are isolated by the incompatability between
European PAL & North American NTSC video technology.

Information about the Fest & NEAR*US may be obtained from the Interim
Committee chairman, Jon Mordosky, at: j.c.mordosky@genie.geis.com.

Stay tuned for further details & updates on what will hopefully be the
largest USA East-Coast Atari SwapFest yet!

4521. Standards For Used 8bit Stuff

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-29 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505290616.AA138138174@relay1.geis.com>
Source record: 91349

Standards for Used 8-Bit Stuff

Noting the recent bruhaha over Jim King's unfortunate RT-8 cartridge got me to wondering about standards for used 8-bit equipment.

In fact, a set of such standards was in common use in Atari Classics magazine "Swap 'n' Shop" section. In fine print under "The Rules". It first appeared in the Dec '92 issue, was reprinted with minor revisions in the Feb '93 issue, & I believe was reprinted occasionally in several issues thereafter. The standards were composed by me, following the practice of several commercial publications dedicated to the used audio equipment market (I've been messing with audio electronics for almost 20 years).

For the benefit of people who never checked the fine print in the Swap column of AC, I'll re-type the standards here:

LN (Like New)-- Item is pristine, unused, w/all manuals & original packaging materials.
EC (Excellent Condition)-- Item is little used, good working order, physically clean, may have a very few minor cosmetic blemishes, w/original manuals.
GC (Good Condition)-- Item is in good working order but slightly soiled, contains worn parts or minor scratches/dings that betray heavy service or old age, w/original manual or copied manuals.
FC (Fair Condition)-- Item in working order but missing manuals/accessories; heavily worn/soiled or cosmetically damaged.
BC (Basket Case)-- Item does not work, is damaged/butchered, missing manuals & accessories etc., but contains salvageable parts.

Under the above rating system I'd guess Jim's RT-8 cart would fall some-where between GC & FC. $25 for an RT-8 in that condition is certainly a fair price. Holding the case halves together with a rubber band is a tad tacky. I'm a scotch-tape man, myself. :) I do recall once selling someone an OSS cart held together with tape. Never had a problem with the ICD carts.

I recommend that the above rating system be incorporated into the FAQ list. If people are going to be buying/selling/swapping used junk thru this newsgroup, then newsgroup participants should have a level playing field.

I personally have both bought & sold a huge amount of material here. I try to give folks a fair deal & have rarely had a serious problem. It also speaks well for the participants here that I've never once been ripped off or gotten a bad check from anyone. Until such time as I do get ripped off, I'll continue my personal policy of shipping merchandise within 24 hours of receipt of payment (typically the same day), without waiting for checks to clear. Most people here are basically honest. (Unlike other areas on the

Internet, where I've heard some really hairy horror stories!) In this area at least, this newsgroup rates high marks.

4522. Atari 8-Bits w/RGB Monitors

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-29 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505290616.AA138188175@relay1.geis.com>
Source record: 91350

Using Atari 8-bit w/RGB Monitors

<Catching up on old e-mail here, several weeks behind as usual... >

Mark,

My best advice is still just to purchase the back issue of Atari Classics magazine, December 1993. Bob Woolley will sell them. AC's address is in the FAQ list which was posted here by Michael Current within the past week or 2.

You'll want to read Woolley's article entitled "TTL Video for the 8-Bit". This article was really a two-fer, it contained one part on doing TTL for the std. 40-column video & a 2nd part on extracting TTL video from the 80-column video module (XEP-80).

I don't believe RGB is possible (at least not without some *really* advanced surgery!). Woolley's mods are only good for monochrome, but they work (the XEP-80 mod is somewhat better than the 40-column mod). The type of TTL/MDA monitor you employ is fairly critical, as per my Editor's Note appended to Bob's article.

Bob's article was well presented, with many photos, diagrams, & electronic schematics. Hardware mods of this kind are *always* best presented in print media. I can't even begin to imagine how information of this nature could be communicated in an on-line forum like this.

- Ben Poehland

PS- Funny thing about that issue of AC. People either *really* liked it or *really* hated it. There was no middle ground of response I received on that one. Fortunately, 70% of the response was positive, only 30% negative. The grumblers' main complaint was that there was so little software type stuff in that issue. It was the only time I ever attempted to pretty much devote one whole issue to a hardware topic. But, given the importance of video to the function of the computer, I figured it was worth it.

4523. XE Keyboard Woes

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-29 00:00:00 UTC
From: b.poehland@genie.geis.com
Message-ID: <199505290616.AA138408187@relay1.geis.com>
Source record: 91351

XE Keyboard Woes

Someone remarked in this thread that "Ben Poehland would probably know what type of plastic is used" for the XE keyboard connector. Well I'm not exactly a polymer identification expert, but it's definitely a polyester-type resin. [If someone will loan me a spare fourier-transform 500MHz nuclear magnetic resonance spectrometer, I'll be glad to nail down the molecular structure for you precisely. :)] But, calling it mylar is close enough (mylar is a type of polyester also).

The one remedy no one mentioned for the oxidized foil traces is one that's the simplest & cheapest of all: a soft pink rubber pencil eraser. (Preferably not one on the end of a pencil, those are usually too hard.) You can get them for maybe 29-cents at virtually any office supply store, Woolworths, 5-&-dime, K-Mart, heck even many grocery stores sell them.

I've used the "Soft Pinkie" numerous times on those mylar keyboard connectors. It's amazing how black they get; a few swipes with the Pinkie & they come up silvery again! The soft rubber is very gentle. I avoid all abrasives like the plague. And something like baking soda would be totally useless. Hmmm... but something like silver polish or Brasso might be worth a try.

Someone mentioned a technique that I'll second: snipping off a few millimeters of the connector to expose fresh trace. The same crummy plastic ribbon is used in many XL keyboards also (mainly units made by Stackpole, with the heavy metal backing). Alps keyboards for the XL were very nicely made, with a much stiffer keyboard connector & a terraced key configuration (the Stackpoles were all planar). Maybe I've just been lucky, but I've never had a keyboard wth a broken trace on the connector. Yuk!

All the XE keyboards had a sculpted configuration, which maybe is why many people liked them. Not me. I had 3 XE machines & dumped them all. The XE hardware was generally just too flimsy for me. I'm only using upgraded 600XLs & 800XLs around here now, their hardware is the sturdiest for people like me who smash up keyboards. :)

In the "Tips 'n' Tricks" column of the October 1993 AC there appeared a fix for supposedly current-deprived contacts from the XE keyboard. You had to solder 3 resistors from points on the keyboard socket to ground. I suggest people purchase that issue (it's available as a back issue, see the FAQ list for the address of AC). I suppose someone might type it in & post it here. But not me, I already typed it once (in 1993) & don't feel like doing it again.

4526. Disk Communicator format

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-29 00:00:00 UTC
From: cmwagner@news.gate.net
Message-ID: <3qdlbq$25qa@navajo.gate.net>
Source record: 91354

With the publication of what the author of dcm2dsk knows on the the dcm format and what I have learned, I wrote a very crude program in C that does some decompression/extraction of the images, but it is not complete and has a known bug which causes premature termination. But I thought I would post what I have written in C here, and the documents that I have written on the DCM format, which are very rough and incomplete, hopefully with what I have, what Jason has, and other information it may be enough for some of us to understand this format better.

I would definately like to find the source code for Disk Communicator, I am wondering if someone who may be in contact with Bob Puff could convince him to make the source code to this program (and maybe some others?) available to the public. Or at the very least maybe he could help write a technical document on the dcm format.

Here is the program, dcmana.c:

```
#include <stdio.h>

void main(int,char **);

void main(int argc,char **argv)
{
FILE *fin,*fout;
unsigned char c,a,d,e,dens,buf[512],bgar[512];
unsigned short cursec=0,lstsec=0,b;
size_t secsize;

if (argc != 3) {
printf("dcmana <input> <output>\n");
exit();
}

memset(bgar,0xFF,sizeof(bgar));

if ((fin = fopen(argv[1],"rb")) == NULL) {
printf("open error %s\n",argv[1]);
exit();
}

if ((fout = fopen(argv[2],"rb")) != NULL) {
printf("already exists %s\n",argv[2]);
exit();
} else {
fclose(fout);
fout = fopen(argv[2],"wb");
}
```

```
a = c = fgetc(fin);

if ((a == 0xFA) || (a == 0xF9)) {
fread(&c,sizeof(c),1,fin);
printf("%02X block: (%02X) last = %X,",a,c,((c & 0x80) >> 7));
dens=((c & 0x70) >> 4);
printf("density = %X %s, section # = %X, ",dens,
(dens ? (dens & 0x02 ? "dbl" : "enh") : "sng"),
(c & 0x0F));
fread(&cursec,sizeof(cursec),1,fin);
printf("sector = %04X\n",cursec);
if (dens & 0x02) {
secsize = 256;
} else {
secsize = 128;
}

for (;;) {
if (kbhit()) {
if (getch() == 27) {
printf("terminated by user.\n");

}
if (c == 0x45) {
printf("45 block: end of file, "
"fell=%lu\n",ftell(fin));
fclose(fin);
```

```
exit();
}
}
}
}
```

Here is my technical documents, it is very rough, but does contain samples of actual encoded blocks and often the decoded block (shows the input and output), dcmtech.1:

All numbers represented here are in hexadecimal.

BLOCK TYPE

If the block type has it's 8th bit clear then there will be two characters following the block representing the sector number to jump to. So there is two types that usually go with each block type. It will write the sector and then set the sector number to what is specified.

Block Type = FA
Description = File Header Block
Length = Fixed, 4 bytes

```
000000: FA 81 01 00 ................
```

The first byte is the block type, the next character is the density type, the following routine will tell you what you want to know:

```
if (densityType and 0F) = 01 then
if (densityType and 70) = 00 then
density=Single:SectorSize=0080:SectorCount=02D0
else if (densityType and 70) = 20 then
density=Double:SectorSize=0100:SectorCount=02D0
else if (densityType and 70) = 40 then
density=Enhanced:SectorSize=0080:SectorCount=0410
else
density=Unknown
```

I am unsure what the following two characters represent, but they likely represent a starting sector number, in this case 0001. Variables in this routine will be identified (if necessary) later in this document with a dollar sign ($) in front of them.

Block Type = C3 / 43
Description = RLE Encoded Block
Length = Variable

```
000000: C3 45 0B 03 D0 07 AE 0A 03 E0 04 90 01 0A 8D 08 .E..............
000010: 03 2A 8D 09 03 A0 31 8C 00 03 C6 48 30 16 AE 02 .*....1....H0...
```

```
000020: 03 E8 8A A2 40 29 06 D0 02 A2 80 8E 03 03 20 59 ....@)........ Y
000030: E4 88 30 E6 A6 2E C8 98 60 10 69 01 FF 80 F6 00 ..0.....`.i.....
000040: 00 00 23 28 50 4D 01 4C 00 4E 52 52 54 D2 80 5C ..#(PM.L.NRRT..\
000050: 0C 5C 0E 62 0D C6 0D 50 0E 67 10 A9 69 8D B8 07 .\.b...P.g..i...
000060: A9 01 8D B9 07 A2 08 8E 01 03 20 B6 0B BD CB 07 .......... .....
000070: 30 12 20 9A 0B F0 0D BD CB 07 C9 0. ............
```

The first byte is the block type, the next character tells us that RLE encoded data begins at offset 45 (this offset would not include the block type and the offset), which brings us to three character 4C 00 4E, 4C tells us how long to decode this, 4C - 45 = 07, so it is 7 bytes long and the encoded character is 00, the next character is 4E, which tells us where the next jump to is, which brings us to 54 D2 80, 54 - 4E = 06, so it is 6 bytes long and the encoded character is 00, the next character is 80, which tells us to jump to offset 80, which is the end of block, decoding is complete and the output shold look like this:

```
000000: 0B 03 D0 07 AE 0A 03 E0 04 90 01 0A 8D 08 03 2A ...............*
000010: 8D 09 03 A0 31 8C 00 03 C6 48 30 16 AE 02 03 E8 ....1....H0.....
000020: 8A A2 40 29 06 D0 02 A2 80 8E 03 03 20 59 E4 88 ..@)........ Y..
000030: 30 E6 A6 2E C8 98 60 10 69 01 FF 80 F6 00 00 00 0.....`.i.......
000040: 23 28 50 4D 01 00 00 00 00 00 00 00 52 52 D2 D2 #(PM........RR..
000050: D2 D2 D2 D2 5C 0C 5C 0E 62 0D C6 0D 50 0E 67 10 ....\.\.b...P.g.
000060: A9 69 8D B8 07 A9 01 8D B9 07 A2 08 8E 01 03 20 .i.............
000070: B6 0B BD CB 07 30 12 20 9A 0B F0 0D BD CB 07 C9 .....0. ........
```

Hopefully you can understand that.

Block Type = C7 / 47
Description = Dump Block
Length = Fixed, $SectorSize bytes

```
000000: C7 4D 03 00 07 E0 07 4C 14 07 03 09 01 E8 1B 01 .M.....L........
000010: 04 00 7D 0A 0B AC 12 07 AD 13 07 20 58 07 AD 10 ..}........ X...
000020: 07 AC 0F 07 18 AE 0E 07 F0 1D 20 63 07 30 18 AC .......... c.0..
000030: 11 07 B1 43 29 03 48 C8 11 43 F0 0E B1 43 48 20 ...C).H..C...CH
000040: 4D 07 68 A8 68 90 DD A9 C0 A0 68 0A A8 60 AD 11 M.h.h.....h..`..
000050: 07 18 65 43 A8 A5 44 69 00 84 43 85 44 8C 04 03 ..eC..Di..C.D...
000060: 8D 05 03 60 8D 0B 03 8C 0A 03 A0 03 A9 52 90 02 ...`.........R..
000070: A9 50 84 48 8D 02 03 18 8C 06 03 A9 80 CA F0 0D .P.H............
000080: AE ..............
```

The first character is the block type, the next 80 bytes is a unmodified dump of the original sector. This happens to be a single/enhanced density sector.

Block Type = C4 / 44
Description = Fill Block
Length = Fixed, 4 bytes ???

```
000000: C4 7E 0C 7D .~.}............
```

The first character is the block type, the next seems to be an offset to fill up to, and the rest is data to be written to the sector. This sector would expand to this:

```
000000: FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF ................
000010: FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF ................
000020: FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF ................
000030: FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF ................
000040: FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF ................
000050: FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF ................
000060: FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF FF ................
000070: FF FF FF FF FF FF FF FF FF FF FF FF FF 00 0C 7D ...............}
```

The last three bytes are 00 0C 7D, a sector link.

Block Type = 45
Description = End
Length = Fixed, 3 bytes

```
000000: 45 00 45 E.E.............
```

The first character is the block type, the next two seem to be in there as safety, or possibly a bogus sector number so large to also signify the end, not sure.

Block Type = C1 / 41
Description = Fill To End of Sector Block
Length = Variable

```
000000: C1 07 60 38 07 06 07 00 01 00 A.`8............
```

The first character (0) is the block type, the next character (1) is the offset, the next character (2) is the character to fill with, the rest data which is a fixed length of character (1) starts at offset 0 but the data is written reversed. Below is the same block but uncompressed.

```
000000: 00 01 00 07 06 07 38 60 60 60 60 60 60 60 60 60 ......8`````````
000010: 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 ````````````````
000020: 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 ````````````````
000030: 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 ````````````````
000040: 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 ````````````````
000050: 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 ````````````````
000060: 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 ````````````````
000070: 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 60 ````````````````

: me? ANy help would be apprecuiated?

: Oh, there were also a bunch of *.exe files along with the *.dcm files, and
: I assume there also some compressed games for the Atari ---but running the
: *.exe files just locked the PC up. Uggg...

Well, I think I had a similar problem. The Xmission server automaticly
'unGNUzips' the files you specify for download, if you omit the '.gz'
suffix. I downloaded some files via 'netscape' and received them
without a '.gz.' suffiz although they were still 'GNUzipped'.

In order to ungnuzip them, you have to add the '.gz' suffix and
run 'unGNUzip' (Sun WS) or or gzip -d (PC) on them. Are you sure you
specified binary when 'FTP'-ing stuff ?.

Good Luck

> sells them for $40 if you don't count the SW fee!) for complete cables.

I believe that TWAUG sells them for a reasonable 22 pounds. You work
out what that would be in dollars :-)

4536. HELP! Ultraspeed TECH

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-30 00:00:00 UTC
From: classics@en.com
Message-ID: <3qdq58$d2d@antares.en.com>
Source record: 91279

Thanks to everyone who responded to my request for information on the
SIO status command! :)

Well, im back at the till once again. Can anyone provide me with
some technical information on sparta's Ultraspeed mode? The
information I need is basically everything:

What is the SIO $3F command and how does an enhanced drive respond to it?

What baud rate does ultraspeed i/o take place at? Does the device continue
to listen for commands at 19.2k?

If someone could help me with this, or point me in the direction of
some deep dark technical information i would be very helpful :)

Thanks!

Steve

4537. XFD disk image format?

4538. FREE-ish Atari Stuff

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-30 00:00:00 UTC
From: steveg@phantom.com
Message-ID: <3qe74u$7r2@dockmaster.phantom.com>
Source record: 91281

I have:

One (1) Atari 800XL (just the computer), beat-up, but still works.
One (1) Atari 1050 w/PS & I/O cable. Doesn't work (power light goes on,
but drive doesn't spin and comptuer doesn't recognize it).
One (1) Atari 1050 w/PS & I/O cable. Doesn't work (don't know what happens;
this one belongs to a friend).
One (1) Atari 1040ST (just the computer). Doesn't work; needs replacement
power supply (I think that's all). New floppy drive; includes extra top
half of case (one is modified to accomodate new floppy drive). Probably
has earliest version of ROMs.

PRICE: Best offer. I will happily trade for a WORKING Black Box, SpartaDOS
cartridge, BBS Express Pro cartridge, and/or 16-bit Atari computer
(1040ST or above). 800XL is in Manhattan; everything else is in central
New Jersey. Leave mail.

4539. The Last JEKING7@delphi.com

Newsgroup: comp.sys.atari.8bit

I just want it reported that the RTime-8 cartridge of questionable
condition that JEKING7@delphi.com sold to me does indeed work. End of thread.

4540. DCM format

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-30 00:00:00 UTC
From: cmwagner@news.gate.net
Message-ID: <3qfl8k$2975@hopi.gate.net>
Source record: 91283

Here is the latest revision to dcmana.c, it supports all of the blocks now. I don't see any bugs, but who knows. It basically ends out with a image, it should be compatible with the XFD format.

```
#include <stdio.h>

void main(int,char **);

void main(int argc,char **argv)
{
FILE *fin,*fout;
unsigned char c,a,d,e,dens,buf[256],bgar[256],last=0,flags=0,lines=0,
createdisk=0,working=0;
unsigned short cursec=0,b,f,maxsec=0;
size_t secsize;

if (argc < 3) {
printf("dcmana <input> <output> [-p]\n");
printf("-p = pager\n");
exit();
}

if (stricmp(argv[3],"-p") == 0)
flags |= 0x01;

memset(bgar,0,sizeof(bgar));

if ((fin = fopen(argv[1],"rb")) == NULL) {
printf("open error %s\n",argv[1]);
exit();
}

if ((fout = fopen(argv[2],"rb")) != NULL) {
printf("already exists %s\n",argv[2]);
exit();
} else {
fclose(fout);
fout = fopen(argv[2],"wb");
}

for (;;) {
if (kbhit()) {
if (getch() == 27) {
printf("terminated by user.\n");
exit();
}
}
```

```
if (feof(fin)) {
printf("no end block\n");
exit();
}

From: esmith@netaxs.com
Message-ID: <3qfgqk$7pd@netaxs.com>
Source record: 91284

Need info as to which of the setups out there will work on the 800 the best way. And which of the HD formats support the largest drives. I have been told of the Black Box, MIO, etc. But not the size they can handle. Also will any of them work properly running under Mydos. What are the going prices for these items. Thanks for the help.

4542. The Atari 8Bit is ALIVE!

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-30 00:00:00 UTC
From: GriffisC@dbm1.mpc.af.mil
Message-ID: <2FCB61B5@dbm1.mpc.af.mil>
Source record: 91285

WOW! I am so glad! I gave up on my poor Atari (130XE, MIO, XF551,Percom,etc...). I absolutely loved it, but all the BBSs here (San Antonio) dried up or were filled with kids. Our only store caved in, and I thought all was lost. Low and behold, I was looking for freeware emulators one day for work and here is something called XF2.ZIP. Hmm... Never heard of that, let's see what it is?! WOW! An Atari! There must be others out there who still use them! I am ashamed of myself for ever doubting the real die-hard 8Bit fans (aficionados?). So, I blew off the dust, dug out the old boxes (I never throw the GOOD stuff away) (the commodore went the way of the dodo bird) and I am Atariing it again!. So, after some diligence and persistence, and some after-hour snooping the 'net, I found this wonderful group, and some FTP sites.

Thanks for hanging in there!

4543. SIO2PC I.C. Help

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-30 00:00:00 UTC
From: zu02523@uabdpo.dpo.uab.edu
Message-ID: <3qfobt$j2i@maze.dpo.uab.edu>
Source record: 91286

I just recently downloaded XF25 and SIO2PC. What GREAT programs!
I have been 8 bit-less for about three years now, and I have missed some of the programs I used to run on my 800XL. I read the documentation on building my own SIO2PC cable, and it states that a Harris ICL232 is needed. I called my local Newark Electronics number, and found that they do carry the chip, but they have about four different versions, each ending in xje (I think..), where x is n, p, etc. I suppose the extension describes the transistors used. What I want to know is, which ICL232 do I need? I'm cutting my time short to study for finals trying to tie my PC and my 8 bit together, so any help would be appreciated.

Also, I saw a few posts about PC Xformer 4.0. Will this be out any time soon, and what features will it add? I was planning on registering for version 3.0, but if 4.0 will be released soon, I'll wait for it to come out. I'm really curious as to whether 4.0 will allow printing and modem communications through the PC's serial and parallel ports.

Thanks in advance!
Mike

: Thanks for hanging in there!

Welcome!

I, too, went away for a while, but returned a year or so ago to my beloved, classic Atari system. After spending a full day writing cutting edge client/server apps on state of the art hardware, there's something relaxing about coming home and playing with my trusty Atari 8-bit - whether it's playing one of the hundreds of outstanding games, or diving back into some of the wonderful innards of Atari programming.

I've decided I want to start writing some games for the 8-bit, so I'm starting to delve into Atari 6502 machine language and some of the cool stuff about the Atari - display lists, player/missile graphics, etc.....some of it familiar ground from the old days, some of it new (and still exciting).

The Atari 8-bits live on here!

Scott

cmwagner@news.gate.net (Chad Wagner) writes:

>Here is the latest revision to dcmana.c, it supports all of the blocks
>now. I don't see any bugs, but who knows. It basically ends out with a
>image, it should be compatible with the XFD format.

At first I wanted to send you a private E-mail, but since you don't hesitate to post large sources to a discussion newsgroup, I might as well post my comments here. (No, I won't quote the whole source :) Before I start commenting/flaming/nitpicking (*) I must say that I really appreaciate the work you're doing!! ((*) strike what's not appropriate)

Well, here we go...

1.) When only 2 arguments are given argv[3] is undefined hence the following is invalid (gives me a core dump on a Sun WS)

```
> if (stricmp(argv[3],"-p") == 0)
```

2.) Also, stricmp is NOT ansi-C. You should use strcmp instead.

```
> for (;;) {
```

3.) The use of "for(;;)" is very ugly. Better use while(1) or even beter, don't use such constructions at all. (What about a termination flag??)

```
> if (kbhit()) {
> if (getch() == 27) {
> printf("terminated by user.\n");
> exit();
> }
> }
```

4.) Both kbhit() and getch() are very unportable. For example, getch() is not readily available on UNIX systems and involves some toggling of tty bits etc.etc. Its use is not recommended.

```
> if (lines>23) {
```

5.) Who says my terminal is 24 lines??? (OK. This is nitpicking)

```
> printf("(%02X-%04X) ",c,cursec);
```

6.) This outputs the wrong numbers! The reason of that will come a little later...

```
> fread(&cursec,sizeof(cursec),1,fin);
```

7.) Here it is. Assuming that every machine has their two bytes that
make up a word stored the wrong way (the Intel way!) is a bad
assumption. You know it's stored LSB/MSB within the file, but
you don't know that it's the same for the machine running this
program. Even worse, you assume an unsigned short is two bytes,
which is not always the case!! (for example, Turbo C 2.0 has
unisigned shorts of 1 byte and so have most C-compilers for
the Atari ST (except gcc and lattice C)) So, one should read
the word bytewise and have something like:

```
cursec = firstbyte + ( secondbyte << 8 );
```

8.) Finally, your program isn't very readible. IMHO one should not
put the whole program in the main() procedure. Splitting it up
will certainly improve your program.

There may be more, but this is enough for a while I think :-) I hope
I didn't sound too much as a schoolteacher, cause that's _not_ my intention.
Well, at the end, we all want to benefit from the program, so why not make
it the best??

Greetings,
Ivo

Message-ID: <spam.801874534@pv3805.vincent.iastate.edu>
Source record: 91290

coolness! I was just tenetivly offered a fairly complete 8-bit atari computer system! 800xl, rambo 256K, hard disk, monitor, printer, MIO, 2 floppies, Action, spartaDOS X, and buckets of books! what happened was this--I went to a garage sale a couple weeks ago. I saw all this equipment stacked up there. it had been sold 5 minutes earlier. *blarg* It went for $100, however, which is far more than I'd pay anyway. The purchasers had gone home to get their car. Anyhows, I left my number with the ppl handling the garage sale, figuring that there was a chance that the purchasers would have no idea what they were doing, and would want to sell it off....

just got a phone call from them... :)

So I'm offering them an 8088 PC that's stacked up in my basement. It's probably far more useful to them then the atari, and I get my ultimate toy...

Ataris were my first computer; I teethed on them. now I get to play with all the toys (particularly a hard disk) I could never afford as a young-un...

:)

4548. I now have an eazy way to use huge sio2pc images with spartados!

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-30 00:00:00 UTC
From: kevina@clark.net
Message-ID: <3qg9mu$jt1@clark.net>
Source record: 91291

How do you use a huge sio2pc disk image with spartados when spartados
refused to format it?

You use a pre-format disk image!

I was deturmed to get a disk image to work so I formated it on the IBM
side using the specks given in the doc and several blank disk images for
comparison. These images are avalible at ftp.clark.net:/pub/atari/spartad.
They are availbe in 1 MB, 2MB etc, all the way to 16MB!

So download the files and check them out but DON'T UNZIP THEN ALL AT ONCE
BECUASE UNZIPPED THE IMAGES TOTAL 136M TO SPITE THIER SMALL ZIP SIZES.

Please do not copy my files to any other archive for the next month or
so. I want to be sure that the images really work brfore I let them loose.

If these disks start acting weird please let me know so I can look into it.

See the readme file for more information.

They are not different, it is the Atari cable that never did conform to
the Standard as they came out just BEFORE the RS232C standard. Once out,
they had to stick with it and so did ICD and the BlackBox.

>Where might I find information on the XFD disk format?

XFD for single disks is just an image, 90K file, each sector is consecutive,
sector 1 is the first 128 bytes, the next 128 bytes is sector 2 and so on.

Well before I retaliate, I will make a notice that I never guaranteed
this code to be portable. It is highly DOS specific, which was it's
original intended platform, I made the code available so that others
could port it and learn the format.

>1.) When only 2 arguments are given argv[3] is undefined hence the
> following is invalid (gives me a core dump on a Sun WS)

I could imagine so.

>2.) Also, stricmp is NOT ansi-C. You should use strcmp instead.

Nope, it is Borland specific, I believe.

>3.) The use of "for(;;)" is very ugly. Better use while(1) or even
> beter, don't use such constructions at all. (What about a
> termination flag??)

I didn't plan the code for neatness, or even to satisfy those who like it
the way they code. I am sure there is many alternatives.

>4.) Both kbhit() and getch() are very unportable. For example, getch()
> is not readily available on UNIX systems and involves some toggling
> of tty bits etc.etc. Its use is not recommended.

I think I covered this above.

>5.) Who says my terminal is 24 lines??? (OK. This is nitpicking)

Examine the code closer, it is actually more toward a 25 line screen. 24
lines of output, and 1 for the message to press any key.

>6.) This outputs the wrong numbers! The reason of that will come
> a little later...

It puts out what I want.

>7.) Here it is. Assuming that every machine has their two bytes that
> make up a word stored the wrong way (the Intel way!) is a bad

> you don't know that it's the same for the machine running this

Change it if you need to. I think I said this was DOS specific.

>8.) Finally, your program isn't very readible. IMHO one should not
> put the whole program in the main() procedure. Splitting it up
> will certainly improve your program.

True. But it was a quick hack, it was nothing more than a hack, I wrote it quickly as possible to support the block types, I was going to put certain things into functions, but I haven't really had a chance. I don't think I will bother at all now.

>There may be more, but this is enough for a while I think :-) I hope
>I didn't sound too much as a schoolteacher, cause that's _not_ my intention.
>Well, at the end, we all want to benefit from the program, so why not make

Well I guess if someone wants these encoder/decoder packages then they will have to just write them, my code isn't good enough. Isn't that what you are trying to say?

Just a quick reminder that any joystick with a standard 9 pin D plug should work with the Atari, even the Sega pad to some extent (expensive and therfore pointless though).

Generally, if it works with most home computers, then it'll work with the Atari.

You can't live in a global society without getting your hands dirty somewhere along the line.

As I recall, it used 16 DLIs in one of the GTIA modes (9 I think).
Every few lines, a DLI would change the color.

I think that was back in my DOS 3 days, and I haven't tried it with
xformer yet.

>you want to send a command....

There's also the matter of the 5-byte command frame, and when to send
it. Also it would be desirable to catch the ACK (or NAK, or whatever)
byte the SIO peripheral sends.

Last night I was comparing the specs for Centronics parallel and Atari
SIO, and I don't think the hardware to do such a conversion (with no
special software in the computer) would be too simple. Maybe a UART
would help, but I'm not real familiar with them...

If you use special software in the computer, the hardware is easy.

Since Ive only had 1, yes 1 response to the question of porting XFD etc
from my amiga to an 8bit (as there is not an emulator on the amiga)
I can only try to get the Game in its 5 1/4 format.

So does anyone have Jumpman & Atari Artist out there...
Let me know if you have..

Thanks Paul..

Hope I get a few more responses than My 1st couple of messages. And I
thought you Americans liked us brits..:-) Maybe not??
Cmon guys us 8 Bit people need to stick together!!!

Don't feel so bad, I got an 8 meg image under AIX as well. I used short because they are supposed to be 2 bytes according to the ANSI C standard, and int can be 2 or 4 bytes (2 on PC, 4 on UNIX). I didn't even bother planning on little endian/big endian, I have never even had a Motorola based computer, so I have never experienced this problem or even consider it. You got to remember I went from the 6502 to the DOS platform, I am just getting into unix, and portability is extremely difficult because of manufacturer specific functions. I could probably think of 20 functions in Borland C that are Borland specific.

What I am going to say is that I will work on custom stricmp() and other routines, I think I even have one. Portability is going to have to be worked on by the users, I can't reach every platform. The best I can do is BSD, AIX, and DOS. AIX is the machine that I am logged into now, and I have BSD and DOS on my computer. (I could work on the Atari as well, but I don't see how this can be done without two disk drives or alot of extra code for disk swapping -- in other words it is not planned). I did want to work on a atrtodcm engine. And just so you know, I do have a later version which has all of the block decompression routines in functions.

I would like to think that Jason Duerstock did alot of the work on reverse engineering the DCM format.

I'm looking for an MS-DOS utility that will let me put
a true double-density Atari 8 bit diskette into a PC's
5.25" disk drive and convert the files on it to an XFD
image file for use by the Xformer 3.0 emulator.

The closest I have seen to this is the ancient and obscure "ATARIO"
utility that copies single files from the Atari disk to the PC
hard drive.

Is there a utility out there that does what I want?

It exists. I know there's a connection list in the P:R: Connection
manual, and there might be one in the FAQ.

>3. What programs will I need at the 8 bit end to decompact the files...

"Disk Communicator" (Discomm) 3.2 for DCM files, Super Unarc for ARC
files.
XFD and ATR files are disk images intended for SIO2PC and the
Xformers. There's currently no way to convert them back to true Atari
disks.

>4. What sites etc are there about for the 8 bit. Seen Xmission but Im trying
>to find Jumpman by epyx (THE Best game next to star raiders & Spelunker).
> My poor old J/man disk has died... sniff sniff

There's always atari.archive.umich.edu (and its infinite
variations...), but I think xmission has more games. Umich should
have all the utilities you'll need, though.

Heck, include some "#ifdef M6502" checks in there, and make it
compilable with CC65 for the 8bits, too!

I hope to do some Atari-related programming within the next few weeks
(after finals next week), and my goal is to have things run on Atari,
MS-DOS, and Linux (and as many other Unices as possible, probably
starting with HPUX). Anything that doesn't require special screen
handling should be universally portable.
I just hope I can get CC65, Borland C, and gcc to agree on what is
considered valid code.

classics@en.com (Steven J Tucker) wrote:

ST> Can someone give me some information on the response the disk drive
ST> provides to the SIO STATUS command?

The European disk monitoring program "DEMON" monitors the SIO disk
status channel in real time. The DLI is in PAL video, but as only the top
two lines of the screen are used to display realtime SIO status, the clipping
of the video window at the bottom of the screen is more or less irrelevent.
I came across "DEMON" when I was looking for SpartaDOS utilities at the
archives such as "DIR-T". This sounds like a handy program to have for
what you are doing.

Ah. Welcome to the wonderful world of SpartaDOS and the "stock" ATARI
XF551 disk drive. I have been battling with SpartaDOS and the ATARI XF551
for a couple of months now. Apparently, SpartaDOS seems to be optimized to
run most efficiently with the ATARI 1050. I am new to SpartaDOS. Are you
new to SpartaDOS or to the ATARI XF551 ?

o "Error: No DOS" This error is no "biggie" (not a big problem). I
get it all of the time. Sometimes it means that I have not made the DOS
file on my disk into a boot file. This is rectified by using the SpartaDOS
"BOOT" command to make the DOS file into a "boot file", e.g.
"BOOT X32F.DOS". "Error: No DOS" comes up all of the time with me. I just
hit the [RESET] key and ignore the message. It seems to be a pause,
rather than a serious problem. Density switching is not the cause of this,
as --ALL-- of the DOS disks I normally use in the course of programming
are double density, double sided (DD/DS). (In fact, in the one case where I
was deliberately loading in a single density picture disk, I was delighted
to discover that SpartaDOS shifted back up to double density without
incident when I put a double density program disk back into the disk
drive. Density shifting appears to be something that SpartaDOS does quite
well!) SpartaDOS allows you to have more than one ".DOS" file on a single
floppy disk at one time. The DOS that is loaded at boot-up time is the one
that was selected via the BOOT command.

o "Hanging OPEN/Close file" A much more serious problem with the
stock, unupgraded ATARI XF551 and SpartaDOS is the "hanging OPEN" problem.
SpartaDOS has a problem closing files on the stock ATARI XF551. Error
trapping does not appear to be very hardy with the stock ATARI XF551 and
SpartaDOS. Just a few days ago I was running CC65, to take one example,
and had a logical error in my source code. CC65 "errored out" at compile
time. The open files on my ATARI XF551 were not closed. In my excitment
to solve the problem I inserted a MYDOS disk that had TEXTPRO on it. This

was big mistake, because as soon as I typed anything SpartaDOS attempted to close the files that were still open and corrupted several of the programs on the MYDOS disk. I have heard several theories about this problem. One theory has it that the "hanging open" is caused by faulty ATARI XF551 ROM code. Another theory has it that since the program opened the files in the first place, that it is the program's responsibility to perform DOS error trapping as well. (So then why doesn't this problem happen in other DOSes?) There is a "software fix" that has apparently been released for this particular problem. There is a "PATH" shell "watchdog" that supposedly scans for open file handle conditions and closes "hanging open" files before any other SpartaDOS operations are performed. The moral of this story is to always precede or follow any SpartaDOS command with an extraneous "DIR" when using an ATARI XF551, so that file integrity might be preserved. Also, never mix SpartaDOS with other DOS types unless you are very careful and use a "working transfer disk" that can be clobbered without ill effects. Never transfer directly from one full disk to another, but use a third floppy in between as an extra safety measure.

o "'Disk Full' Problem" Another problem with SpartaDOS and going between disk formats is that SpartaDOS will not report a "Disk Full" condition on an ATARI DOS 2.5 or ATARI DOS 2.0 disk. That is to say, if you insert an ATARI DOS single density disk full of files and attempt to copy or write to it, the COPY or SAVE command will fail, but the cause of failure will not be reported under SpartaDOS. There is no harm done. No data is lost. Neither does the disk fill up. The DOS behaves normally. It is just that the "Disk Full" error condition of the ATARI DOS 2.5 disk is never reported back to the user. The disk operation just halts for no apparent reason.

The equipment under which I have had these occurences is an ATARI XF551 "stock", ATARI 800XL "stock", ATARI 850 serial interface, using SpartaDOS 3.2gx. SpartaDOS appears to be fairly tempermental when using an ATARI 800XL and an ATARI XF551 drive. Owners of the ATARI 1050 drive keep asking me what sort of problems I keep encountering with SpartaDOS. This leads me to believe that perhaps these problems are not as common when using an ATARI 1050 disk drive, as ATARI 1050 owners appear to be unaware of them ??? Good luck with your ATARI XF551. I am glad to hear that other ATARI XF551 owners are having the same problems that I am having. For a while there I thought that I was alone in having these problems. Also, please remember that I am very new when it comes to using SpartaDOS. Essentially, I am still trying to get started at this stage. I am much more familiar with other ATARI DOSes, as SpartaDOS was only released non-commercially quite recently.

> Plain and simple. Just dont use them. (grin) As for portability,

It is difficult to tell what is Borland specific, I know the only thing that it does puke on when I compile under ANSI C is fileno(), that is it, other than that it considers it 'ANSI' compliant. I will just have to port it to BSD and see what doesn't work. <grin> But I didn't write it to be portable off the bat, I would work on that later, once I got the program working (which dcmtoatr.c is at that point, only thing it offers over dcmtodsk is the fact that it is in C and I do have plans of porting it to atleast BSD and AIX). I guess I can deal with the little endian/ big endian issue now, that is not too difficult.

> As for things coredumping, You should always check the value of argc
>and if it isnt what you're expecting, then you should print out a little

What the real problem is that it was a quick and dirty hack and the code was not totally complete, so he encountered a problem with the code which I expected, but I didn't expect to hear people bitching and moaning until I had something real to offer. Maybe I didn't express this in a way that everyone could understand, oh well.

>usage message. This is common practice under Unix.

And I would say under DOS, too.

> What exactly does stricmp() do anyways? I've never heard of it, but if
>its like strcmp() then use that, as it is ANSI-C and POSIX.1 standard.

It is strcmp but it does case insensitive compares. I think there is a library of the str functions online somewhere, I have a few str functions written in C, but not this one and I don't feel like writing it. <heh>

DON'T use XFD unless you HAVE to (ie, you're trying to use ST Xformer).
The XFD format is only around to support users who used to have ST Xformer
and now use PC Xformer.

The REAL versatile, standard, non-Atari disk image format is ATR.

It's format is well documented.

4572. NEW: Atari 800 emulator for Unix et al.

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-31 00:00:00 UTC
From: David Firth <david@signus.demon.co.uk>
Message-ID: <1995May30.220322.314@signus.demon.co.uk>
Source record: 91298

If anyone would like a copy of this program or can suggest a suitable
ftp site please E-mail me or post a followup message. Its supplied
in a 30K tar.gz file. ROM images should be obtained from the XF25
package.

The README file follows:-

Atari 800 Emulator for Unix et al, Version 0.1

Copyright (C) 1995 David Firth. E-Mail: david@signus.demon.co.uk

This program is free software; you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation; either version 1, or (at your option)
any later version.

This is the first release of my Atari 800 emulator for Unix (consider
it an early Alpha). My main objective is to create a portable freely
distributable emulator (i.e. with source code available). It can be
configured either as text only or using X-Windows.

The text only mode is only useful for running programs such as MAC65,
Atari Basic etc. I have had this version running on Linux, SunOS 4.1.3,
Solaris 2.4, VAX/VMS, CBM Amiga (Dice C) and the HP-UX 9000/380.

The X-Windows version supports graphics but runs *very* slowly. This
appears to be beacuase of the refresh rate that I am achieving through
X-Windows.

I create a window of 384 pixels by 240 pixels which is enough
overscan graphics. I also create an Image of the same size.
The Image is built up scanline by scanline by calling the
X-Windows PutPixel function. When the Image is complete the
X-Windows PutImage function is called to move the Image onto
the window. I tried writting directly to the Window but that
appeared to be even worse.

If anyone has any suggestions as how to improve the refresh
rate please forward them to david@signus.demon.co.uk

I used to have support for SVGALIB in Linux but removed it when I increased
the resolution for overscan modes. Thinking about it, I could have just
copied the base 320x192 pixels onto the screen - I'll probably put it
back in.

Why have I written this emulator instead of using PC Xformer?

A few years ago (85/86) I wrote a small 'test' compiler for the Atari 800
computer (It was never released commercially but has had a commercial
game written in it - Enigmatix released by Page 6). For historical reason
I would always like to be able to keep a usable copy of my first compiler.
This was not possible using PC Xformer since it only runs on MS-DOS and
without access to the source code have no chance of porting it to
future computers. This emulator originally had a text only interface
which is all I needed, but as so often happens one gets carried away :-)

PS. If anyone is intrested in the compiler I can make that available
as well.

Features

48K/52K Atari 400/800 emulation (optional RAM between 0xc000 and 0xcfff)
Slow and Slow modes of operation :-(
Should run on any Unix computer running X-Windows.
Display List Interrupts.
Vertical Blank Interrupts.
All Antic Display modes.
Player Missile Graphics with collision detection.
Character vertical reflect, invert and blank.
Files can be stored directly on your host computer via the H: device.
(H: replaces the C: device which serves no useful purpose)
Reads XFD disk files.
PIL modes - allows memory between 0x8000 and 0xbfff to be toggled
between RAM and ROM.

Bugs / Known Problems

A lot of colours have the wrong RGB values. Contact me if you know a
way of converting the Atari colours into RGB values. I am using a
lookup table but a lot are just set to cyan (R=0x00, G=0xff, B=0xff).

A few programs cause the emulator to enter its built in debugger. The
reason for this is unknown at the moment.

Future Atari 800 Enhancements

Hardware scrolling - pointless until the screen refresh rate is improved.
GTIA graphics support for ANTIC modes.
Atari 800XL/XE emulation.
Printer support (Print to file + spool on close).
Disk swapping
Specify cartridge to load.
Paged memory using PORTB.

It may be possible to add support for Super Cartridges - The only
problems are :-

1. I don't have any.

2. I don't know the how the banks are selected. I assume that
it would be by writing to an appropriate bank selection
address. If so, it could be easily emulated with additions
to the GetByte and PutByte functions.

If you ever can't find a joystick, you can always make just about ANY joystick work on an atari. (i.e. My old Nintendo ---i turned 1 joystick into atari).

am i going to explain this? no.

it's take too long.

But if you really want to know, send me e-mail.

Don't Panic
RZabaga@AOL.COM

4574. Re: Who's got Sir Galahad & Holy Grail?

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-31 00:00:00 UTC
From: rzabaga@aol.com
Message-ID: <3qgq3k$d0l@newsbf02.news.aol.com>
Source record: 91300

About Sir Galahad (which i was never really able to figure out what the
hell
was going on):

I probably still have it on a disk somewhere.

Maybe you have something on a disk somewhere that i might want?

-don't panic (unless it's
absolutely required)

4575. Re: 8-bit files from Mac -> Atari?

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-31 00:00:00 UTC
From: richczeta@aol.com
Message-ID: <3qh64k$fv4@newsbf02.news.aol.com>
Source record: 91301

I don't know about a Macintosh "sio cable", but I simply use a direct serial connection between my Macintosh and an 850 interface with Bobterm on the Atari end and ZTerm on the Mac end. My setup is an 850 with a handmade D-9 to standard RS-232 D-25 adapter cable plugged into port 1, a null modem adapter on the D-25 end, then a 25' D-25 female/ D-25 female straight-through serial extension cable that plugs into the mini-8 to D-25 cable that comes with every modem package for the Mac I know of on the other end. My Mac and Atari are in separate rooms; the 25' cable is just long enough to connect them.

Here's the relevant section from the Atari 8-bit FAQ:

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed but also pins 4 and 5 as well as 6 and 8. Or better yet, make a true 25 wire, straight through cable and use a commercial null modem. A commercial null modem is just a small device with the correct lines already crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

R1: Serial port (850 Interface Module):
5 4 3 2 1
9 8 7 6
1. Data Terminal Ready (DTR, Ready Out)
2. Carrier Detect (CRX, In)
3. Send Data (out)
4. Receive Data (In)
5. Signal Ground
6. Data Set Ready (DSR, Ready In)
7. Request to Send (RTS, Out)
8. Clear to Send (CTS, In)

P.S. I prefer a separate straight cable and null modem adapter myself...
You can get all the parts you need, including those for an Atari 850
to RS-232 25-pin adapter, at Radio Shack.

that portion reproduced is not modified, and so long as credit is given to
this FAQ list or its Maintainer, or the author of that section reproduced
when given.

The Atari 8-Bit Computers Frequently Asked Questions List was created to
provide answers to many commonly asked questions found in the Internet's
comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group. It is in
a constant state of development, and comes with no guarantees. If you
see any problems, I need to hear from you!

--- Where to get the latest copy of the 8-bit Atari FAQ List ---

The home of many FTP archive sites, automatically updated monthly:

13.4) What are the pinouts for the...?
13.5) What BBS software can be used on the Atari?

Other Documents of Interest
14.1) What vendors, developers, or publishers support the 8-bit Atari?
14.2) Where is my nearest 8-bit Atari BBS?
14.3) Where is my nearest 8-bit Atari user group?
14.4) How do I use my new or emulated Atari?
14.5) What prominent Atarians are reachable by e-mail?

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari

engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

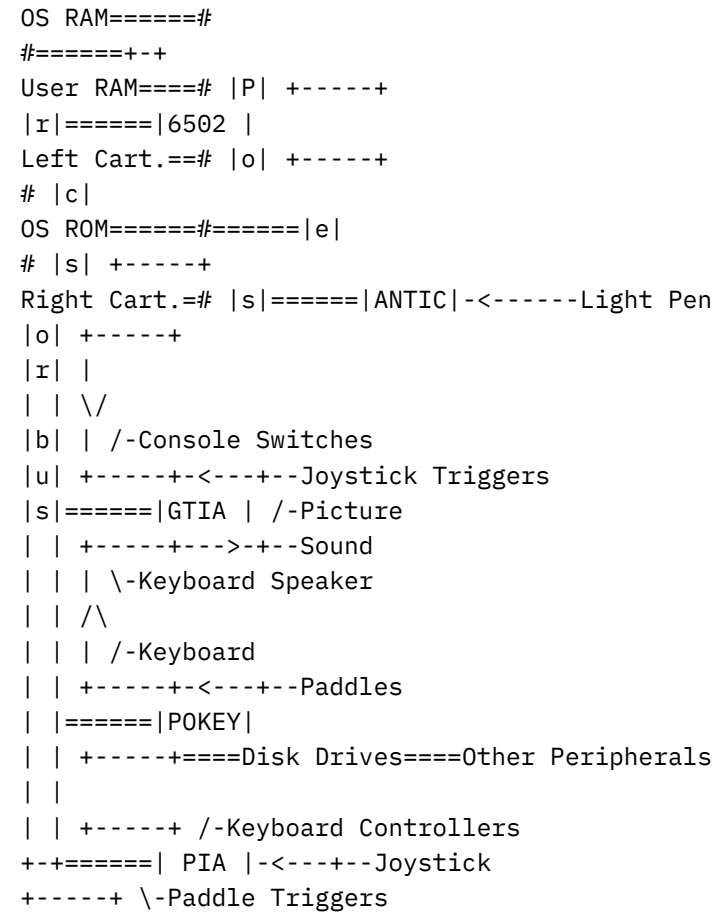
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE. According to mailto:masstorage@closer.brisnet.org.au (Masstorage), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO freddy) and an extra 8 RAM

chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill
Kendrick, mailto:kendrick@sonoma.edu, for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, character
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed,
the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,
and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text

3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through news:comp.sys.atari.8bit. This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

news:comp.sys.atari.8bit is archived by the INFO-A8 listserv.

Subject: 2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from mailto:lexicor@world.std.com

---

Subject: 2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements. The moderator may be contacted at mailto:emulators-request@qualcomm.com

---

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:atari8@netcom.com

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to mailto:atari8@netcom.com will NOT be cross-posted to news:comp.sys.atari.8bit. The Moderator is presently working to correct this.

The Info-Atari8 Digest is archived by the INFO-A8 listserv.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@vm.marist.edu, message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in the Info-Atari8 Digest.

Any postings sent to mailto:info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach news:comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST, or by sending a message to mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please note that this command must NOT be sent to INFO-A8@MARIST nor to mailto:info-a8@vm.marist.edu.

The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8:

You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST or by sending a message to mailto:listserv@vm.marist.edu that says "index info-a8". These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or by using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
mailto:ravi@mcnc.org (Ravi Subrahmanyan)
mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of this FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send e-mail to: mailto:atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu. Please name

the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

Of the mail-servers listed here, I recommend this "BITFTP" server. To help you
get started using it, try this example of retrieving files from the Merit/Umich
Software Archives (through the barnone.citi.umich.edu mirror site). Send a
message to bitftp@pucc.princeton.edu that says exactly:

```
ftp barnone.citi.umich.edu
user anonymous
cd /afs/umich.edu/group/itd/archive/atari/8bit
dir
cd Telecomm
dir
get ft80v037.txt
get icet.txt
binary
get ft80v037.arc
get icet.arc
quit
```

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

Subject: 3.6) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com
(Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing
the following single line. (What you put on the subject line doesn't
matter; blank is OK. This line should go in the text of the message.)
You will receive as a reply a simple page intended to help you learn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu; the Atari Archive as a whole is
maintained by Mickey Boyd, mailto:boydm@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
----
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)
d)

ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, United States)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/atari/8bit
(141.211.128.22, United States)

g) ftp://phlem.ph.kcl.ac.uk/pub/Atari8bit (137.73.4.24, United Kingdom)

h) ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
(147.70.146.36, United States)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is
maintained by Adam Bryant, mailto:adb@albert.bu.edu. This site seems to
have seen no uploads for years, but there are some files here that aren't
on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen,
mailto:eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net.

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Closer To Home Archive?

Here is a fairly large FTP site in Australia kept by
mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer.brisnet.org.au/pub/archive1/8_bit (203.4.149.97)

Support site for James Bradford's Super 8-bit Products including SuperDos,
SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer.brisnet.org.au/pub/incoming

Subject: 4.7) What is the James King Archive?

Here is a growing 8-bit Atari FTP site kept by mailto:jeking7@delphi.com (James
King)

ftp://ftp.xmission.com/pub/users/j/jeking/8bit (198.60.22.3)

Uploads go in ftp://ftp.xmission.com/pub/users/j/jeking/uploads

---

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National
Public Telecomputing Network. It can be accessed by any of the following:
telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or
telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group C.A.I.N. - Central Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari Community E-Mail Directory" listing. Send correspondence and press releases to mailto:xx004@cleveland.freenet.edu.

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne at mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.5) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100 terminal. Log in as www. Does not allow users to "go" to arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on your system if your administrator has not done so already. The

best plain-text browser, so move mountains if necessary to get
your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser
in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest
of the world. The line mode browser, plus extra features. Log
in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several
browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive through
Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I
personally recommend this method for downloading from the Merit/UMich
Archive.

There are also several mirror archive sites with Gopher servers:

gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit

gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit

gopher://gaia.ucs.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.
edu/atari/8bit

Subject: 7.1) What WWW pages support the 8-bit Atari?

Atari 8-Bit Computers FAQ and Vendor/Developer Lists
Michael Current, mailto:mcurrent@carleton.edu
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq.html

Atari 8-Bit Home Page
Ivo van Poorten, mailto:ipoorten@cs.vu.nl
http://www.cs.vu.nl/~ipoorten/Atari.8bit.Homepage/index.html

Atari 8-Bit Resort
http://www.uni-karlsruhe.de/~un55/8bit.html
Marek Tomczyk, mailto:Marek.Tomczyk@stud.uni-karlsruhe.de

Big Atari 8bit Home Page
Tomasz Tatar, mailto:tatar@student.uci.agh.edu.pl
http://www.uci.agh.edu.pl/student/airgrp/tatar/public_html/Atari/hp.html

Central Atari Information Network
Cleveland Free-Net Atari SIG, mailto:xx004@cleveland.freenet.edu
http://ace.cs.ohiou.edu/personal/mleair/cain.html

Rob Funk's pages
http://www.cis.ohio-state.edu/~funk/

CompuCat BBS
Neal Kinney, mailto:nkinney@netcom.com
ftp://ftp.netcom.com/pub/nk/nkinney/html/compucat.html

Classic Computer and Video Game Systems
http://www.gate.net/~cmwagner/atari8.html

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

Downloading

Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading

Just cp the file into /afs/umich.edu/group/itd/archive/atari/8bit/New
[What is the propsero:// URL for this?]

Subject: 7.9) What is #Atari8?

There is a channel on Internet Relay Chat for 8-bit Atari users. Its
name is #Atari8. Join #Atari8 on port 6667 (EFNet) and enjoy (if you
meet somebody there).

There should be a small bot called XE_BOT on this channel. While on
channel #Atari8 use the command
/msg XE_BOT help
for more information.

The latest information on #Atari8 and the XE_BOT may be found here:
http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/Atari/irc.html

Channel #Atari8 and the XE_BOT are the work of Tomasz Tatar,
mailto:tatar@student.uci.agh.edu.pl.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online magazine of the Cleveland Free-Net Atari SIG. The editor is Mark Leair of the Atari SIG. 8-bit computers support is provided by Michael Current and Craig Lisowski. For information, write to the Atari SIG at mailto:xx004@cleveland.freenet.edu.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The archives contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

.xmo stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always (see companion Vendor/Developer List for complete contact info). A freeware 8-bit Atari emulator for the Atari ST.
Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer, from Branch Always (see companion Vendor/Developer List for complete contact info). The 8-bit Atari emulator for DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 is the commercial version.

The following further info on PC Xformer provided by Bill Kendrick, mailto:kendrick@sonoma.edu. Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU. It does not support ROM files, disk image swapping within the program, player/missile graphics collision detection, sound, PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800 or an Atari 800XL. It requires about the same as 2.0. It does support ROM files and the PC speaker is used to emulate the old Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800, 800XL, or 130XE (128K RAM; I heard it was to do 320K but I think that was reduced). It requires a 386 and 512K of memory. It supports Sound Blaster, player/missile graphics collision detection, modem/printer and PC joystick support. It comes with a disk with the software, an ammendum to the printed documents, and a bunch of Atari 8-bit software (example programs: demos/games, and a few useful utilities). It supports disk swapping through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains SpartaDOS/MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No

Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
Merit/UMich: Telecomm/ft80v037.arc

Ice-T 2.0 XE (requires 128K) or 1.1 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: Yes (2.0 XE) or No (1.1)
Backscroll buffer: Yes--8 screens (2.0 XE) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.0 XE) or No (1.1)
Summary: Excellent for high-speed VT100 emulation
Beta-test versions of both available from mailto:bruck@brachot.jct.ac.il

---

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

While the above work with SS/DD 180K Atari-format disks, the following combination of utilities can be used to work with SS/SD 90K Atari-format disks, and is currently the best bet for reading SS/ED 128K Atari-format disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
Merit/UMich: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
Merit/UMich: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu,
"As best as I can figure it out, if your PC drive happens to read FM disks (I'm not sure what the criteria for that is), then you can read single density disks on your PC by dumping the contents to a file with AnaDisk, and then using Deana.com to convert the dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first portion of each sector, but it demonstrates that it is possible for a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050 drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be used to read/write to a hard drive connected to an MS-DOS system. This can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected

together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

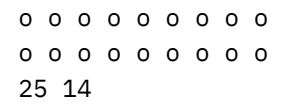
A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.



(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

SS SD Warp speed

==> Atari 1050
SS SD/ED 19.2Kbps standard

==> Happy 1050
SS SD/ED/DD Warp speed US Doubler/19.2 and 52k. track
buffering

==> Super Archiver 1050
SS SD/ED/DD Ultra Speed 50+K

==> Speedy 1050
SS SD/ED/DD 78K mode (European) unknown DOS restrictions

==> Supermax 1050
SS SD/ED/DD 19.2k and 52k (ultra speed)
by Super products. Compatiable with superdos and US Doubler

==> Lazer 1050
SS SD/ED/DD Another Happy clone; Compatible w/ US Doubler

==> Atari XF551
SS/DS SD/ED/DD 38K burst mode usable only with SpartaDOS X,
SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2. XF DS system now
considered "standard".

==> CSS XF551
SS/DS SD/ED/DD US Doubler compatible. Updates drive to work
better and faster. Also 3.5" upgrade available

==> Percom Various/RFD
Various. Any IBM mech from SS/SD 5.25 to 720K 3.5" NOTE: no ED
19.2K standard only. Unique DS system

==> Percom AT-88
SS SD

==> Percom AT88-S1PD
printer port

==> Trak ATD1
SS SD

==> Trak ATD2
SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB

- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel

DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up
to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to
16 megs. SIO2PC also lets you redirect the printer output to your PC
printer or to a file on the PC. High speed drives are emulated (a la US
Doubler).

All these functions are transparent at the Atari end; you never notice the
difference between SIO2PC and regular drives, except that the SIO2PC drives
are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari
users should treat themselves to either MYDOS or SpartaDOS to appreciate the
power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides
subdirectory and hard-drive support. SpartaDOS is a completely different
command-line DOS modelled after MS-DOS, though it is perfectly capable of
reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based;
SpartaDOS X 4.21 is cartridge-based and includes many additional features.
SpartaDOS is available from Fine Tooned Engineering (see companion vendor/
developer list); MYDOS 4.53/4 is freeware from Wordmark Systems (Charles
Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for
complete compatibility with existing software, and then choose either SpartaDOS
or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on
the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS 3.2)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)~same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.

822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari
components?

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have. I'm also not sure how much
of this section is valid outside North America. If it's not valid where
you are, I need to hear from you!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:
1010
9 V AC 15.3 VA (1.7 A) Atari#CO14319 transformer:

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included

designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).

FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in Action! and only supports XMODEM Checksum transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial programs. I haven't heard anything about OASIS IV and CARINA for a while, but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

1) See the "Atari 8-Bit Computers Vendors and Developers List." The latest version may be obtained in the following locations:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit news:comp.answers news:news.answers
mailto:mail-server@rtfm.mit.edu, message says:
send usenet/news.answers/atari-8-bit/vendev
quit

You can also ask me for a copy at mailto:mcurrent@carleton.edu

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar,

mailto:r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained by Lawrence Estep, AC's Telecommunications Editor, mailto:71450.1050@compuserve.com.

Subject: 14.3) Where is my nearest 8-bit Atari user group?

An 8-bit Atari user group listing is maintained by Atari Classics magazine's Exchange Editor, James King, mailto:jeking7@delphi.com.

Subject: 14.4) How do I use my new or emulated Atari?

"The Unofficial Atari 8bit Newbie / Stupid Question / Emulator Help FAQ" is maintained by Bill Kendrick, mailto:kendrick@sonoma.edu. You can write to Bill at New Breed Software, 59 Palm Lane, Novato, CA 94945.

Subject: 14.5) What prominent Atarians are reachable by e-mail?

The "Who's Who in the Atari Community E-Mail Directory" listing covers people involved in all of the Atari computing and gaming platforms. This file is maintained by Len Stys, SIG Manager of the Cleveland Free-Net Atari SIG. Write to the Atari SIG at mailto:xx004@cleveland.freenet.edu.

4577. Stationfall

Newsgroup: comp.sys.atari.8bit
Date: 1995-05-31 00:00:00 UTC
From: smrgoodw@reading.ac.uk
Message-ID: <3qh8qv$4n0@susscsc1.rdg.ac.uk>
Source record: 91303

I purchased a secondhand copy of Stationfall some time ago, minus instructions.
Recently I wanted to have a go at it but after a few hours I gathered that I
needed some coordinates which I believe are in the instructions.

Could anyone let me know what these coordinates are of the Space Station
you are trying to get to or does it depend on my copy?

Anyone who can help out, thanks.

- Joel G.

4578. ATR->DCM

Newsgroup: comp.sys.atari.8bit

For: kendrick@zippy.sonoma.edu (William Kendrick)

>But, unfortunately, there is no DSK2DCM (ATR -> DCM) converter.. actually,

So, what system would you prefer the ATR->DCM converter to run on? It would be easier to write an ATR-> Atari physical disk converter, I know how to write raw sectors to disk. Same for XFD...

I just got my PC XFormer 3.0 in the mail, and it is great! Has anyone gotten sparta/fte to run on it?
(By the way, I don't consider myself a pseudo-atarian, I have owned an atari 8bit for 13 years!)

ANYONE WHO CAN RUN ATARI SOFTWARE AND WISHES TO CONTRIBUTE to the Atari realm is wholly welcome! I don't think negativism is going to help keep our terrific hobby alive!

Craig

OK. Please don't get me wrong, I really appreaciate that!!

>>5.) Who says my terminal is 24 lines??? (OK. This is nitpicking)

>Examine the code closer, it is actually more toward a 25 line screen. 24
>lines of output, and 1 for the message to press any key.

Oops, you got me there! :)

>True. But it was a quick hack, it was nothing more than a hack, I wrote it
>quickly as possible to support the block types, I was going to put certain
>things into functions, but I haven't really had a chance. I don't think I
>will bother at all now.

Because of my reaction? or simply because it works for you?

>Well I guess if someone wants these encoder/decoder packages then they will
>have to just write them, my code isn't good enough. Isn't that what you are
>trying to say?

Not exactly. When I compiled it on an MSDOS machine it _did_ work, but it
outputted a mere 8MB (!) under Solaris. Anyway, you did a great job by
figuring out the DCM format. No hard feelings please about what I said.

Ivo
